Dornier Do 217 Units of World War 2 Chris Goss,2021-09-16 The Do 217 had a much larger bomb load capacity and had considerably greater range than the Do 17, which it replaced in frontline service from mid to late 1941. Although initially used simply as a bomber, later variants were developed to allow the Do 217 to undertake the precision maritime strike role. In order to perform the latter mission, the Do 217 was modified to launch glide bombs – units employing these pioneering weapons enjoyed some success in the Mediterranean from the autumn of 1943. During the course of these operations the Do 217 became the first aircraft in military aviation history to deploy a precision-guided bomb in combat in the form of the 'Fritz X' radio-guided, free-fall weapon, which sank the Italian battleship Roma shortly after Italy capitulated in September 1943. The Do 217 served on all fronts, and was often used on anti-shipping strikes during the Battle of the Atlantic and against the Allied invasion fleet at Normandy. This versatile aircraft was also converted into a nightfighter, seeing action in the Defense of the Reich through to war's end. This highly illustrated study explores the design and development of the Do 217 and chronicles its use in the frontline as a strategic bomber, launch platform for first generation precision weapons, reconnaissance aircraft and nightfighter, among others.

Handbook of 217Plus Reliability Prediction Models William Denson,2006 217Plus is a methodology and a software tool that was developed by the RIAC to aid in the assessment of system reliability. It represents the next generation of the PRISM software tool initially released in 1999. The original software contained six embedded models to estimate the failure rate of various components when exposed to a specific set of stresses that are defined by the user. The 217Plus contains twelve embedded component models. Until the release of this handbook, the equations comprising the component reliability prediction models were not available in printed form. As such, a user of the old software tool could not see the exact equations that comprised the models. It is always advantageous for analysts to be able to review details of the models, so that reliability prediction results can be better interpreted and supported through mutual practitioner, management and customer understanding. The RIAC, therefore, developed and published this handbook to make available the equations and model parameters that form the basis of the 217Plus methodology.

An author's note provides historical origins and fascinating facts, but beware: sometimes real life is stranger than fiction.
