Genetic Steroid Disorders Perrin C. White,2013-08-22 Humans have two isozymes with 11β-hydroxylase activity that are respectively required for cortisol and aldosterone synthesis. CYP11B1 (11β-hydroxylase) converts 11-deoxycortisol to cortisol and 11-deoxycorticosterone to corticosterone, is expressed at high levels and is regulated by ACTH. CYP11B2 (aldosterone synthase) is normally expressed at low levels and is regulated mainly by angiotensin II and potassium levels. The latter enzyme also has 18-hydroxylase and 18-oxidase activities and thus can synthesize aldosterone from deoxycorticosterone. Mutations in the CYP11B1 gene cause steroid 11β-hydroxylase deficiency, a form of congenital adrenal hyperplasia. Mutations in CYP11B2 result in aldosterone synthase deficiency, which can cause hyponatremia, hyperkalemia and hypovolemia in infancy. These are both recessive disorders. Unequal crossing over between the CYP11B genes can generate a duplicated chimeric gene, causing glucocorticoid-suppressible hyperaldosteronism, an autosomal dominant form of hypertension. Frequent polymorphisms in these genes can affect aldosterone secretion and risk of hypertension.

Transcriptome Profiling Mohammad Ajmal Ali,Joongku Lee,2022-10-07 Transcriptome Profiling: Progress and Prospects assists readers in assessing and interpreting a large number of genes, up to and including an entire genome. It provides key insights into the latest tools and techniques used in transcriptomics and its relevant topics which can reveal a global snapshot of the complete RNA component of a cell at a given time. This snapshot, in turn, enables the distinction between different cell types, different disease states, and different time points during development. Transcriptome analysis has been a key area of biological inquiry for decades. The next-generation sequencing technologies have revolutionized transcriptomics by providing opportunities for multidimensional examinations of cellular transcriptomes in which high-throughput expression data are obtained at a single-base resolution. Transcriptome analysis has evolved from the detection of single RNA molecules to large-scale gene expression profiling and genome annotation initiatives. Written by a team of global experts, key topics in Transcriptome Profiling include transcriptome characterization, expression analysis of transcripts, transcriptome and gene regulation, transcriptome profiling and human health, medicinal plants transcriptomics, transcriptomics and genetic engineering, transcriptomics in agriculture, and phylotranscriptomics. Presents recent development in the tools and techniques in transcriptomic characterization Integrates expression analysis of transcripts and gene regulation Includes the application of transcriptomics in human health, genetic engineering and agriculture

Glaucoma Research and Clinical Advances John R. Samples,Paul A. Knepper,2018-04-24 Foreword Volume 2 of our serial publication continues our desire to address glaucoma with a combination of science and speculation. As science expands, the emphasis is on data, interpretation, and dogma. We disagree; open minds open new approaches. Using methodologies that are primarily molecular and genetic, we seek to refine the causes of glaucoma as well as how it is best treated, especially incorporating thoughts and hypotheses about new methods of treatment. Glaucoma is a complex disease, and genetics proves that a variety of proteins are culpable at one level. At another level, however, there are likely final common pathways and numerous feedback loops which have defied explanations to date. The search for answers goes on in basic science researcher's laboratories and clinical ophthalmologist's offices and operating rooms. We are all well-served by understanding that glaucoma is a neurodegenerative disease. Current attempts to solve the disease have focused on two strategic arenas: the trabecular meshwork function and its impact on intraocular pressure as a major risk factor for the disease; and the optic nerve dysfunction leading to visual loss. Genetic mutations have yielded puzzling clues to the cause, but without resolution. For example, mutations in myocilin and optineurin genes are closely connected to the phenotype, but how do they cause the disease? In the next two years, priority areas of research are signaling pathway discoveries, biomarker panels, epigenetic factors, and continued genomic studies to yield answers to the common final pathways of the disease. The final pathways are complex and redundant, such that the overlap of bio-informatics will be challenging. Current promising leads suggest the innate immune system holds important clues to both trabecular meshwork and optic nerve pathophysiology. When the primary open-angle glaucoma disease pathways are unraveled, drug discoveries and new treatment modalities will be available for better regulation of intraocular pressure and neuroprotection for the optic nerve. This volume discusses the glaucoma pipeline from several perspectives as well as future candidate classes. As always, the authors herein are urged to speculate on how the cure of glaucomatous optic nerve damage will yield to new treatments. John R. Samples Clinical Professor, Elson S. Floyd College of Medicine, Washington State University School of Medicine www.glaucomaconcepts.com Paul A. Knepper Associate Professor of Ophthalmology, Feinberg School of Medicine, Northwestern University Medical School Research Scientist, University of Illinois at Chicago

Holographic Sensors Ali Kemal Yetisen,2014-12-03 This thesis presents a theoretical and experimental approach for the rapid fabrication, optimization and testing of holographic sensors for the quantification of pH, organic solvents, metal cations, and glucose in solutions. Developing non-invasive and reusable diagnostics sensors that can be easily manufactured will support the monitoring of high-risk individuals in any clinical or point-of-care setting. Sensor fabrication approaches outlined include silver-halide chemistry, laser ablation and photopolymerization. The sensors employ off-axis Bragg diffraction gratings of ordered silver nanoparticles and localized refractive index changes in poly (2-hydroxyethyl methacrylate) and polyacrylamide films. The sensors exhibited reversible Bragg peak shifts, and diffracted the spectrum of narrow-band light over the wavelength range $\lambda_{\text{peak}} \approx 495\text{-}1100$ nm. Clinical trials of glucose sensors in the urine samples of diabetic patients demonstrated that they offer superior performance compared to commercial high-throughput urinalysis devices. Lastly, a generic smartphone application to quantify colorimetric tests was developed and tested for both Android and iOS operating systems. The sensing platform and smartphone application may have implications for the development of low-cost, reusable and equipment-free point-of-care diagnostic devices.
