The Science of Musical Sound William Ralph Bennett Jr.,2018-09-04 This textbook is a product of William Bennett's work in developing and teaching a course on the physics of music at Yale University to a diverse audience of musicians and science students in the same class. The book is a culmination of over a decade of teaching the course and weaves together historical descriptions of the physical phenomena with the author's clear interpretations of the most important aspects of the science of music and musical instruments. Many of the historical examples are not found in any other textbook available on the market. As the co-inventor of the Helium-Neon laser, Prof. Bennett's knowledge of physics was world-class. As a professor at one of the most prestigious liberal-arts universities in the world, his appreciation for culture and humanities shines through. The book covers the basics of oscillations, waves and the analysis techniques necessary for understanding how musical instruments work. All types of stringed instruments, pipe organs, and the human voice are covered in this volume. A second volume covers the remaining families of musical instruments as well as selected other topics. Readers without a background in acoustics will enjoy learning the physics of the Science of Musical Sound from a preeminent scientist of the 20th century. Those well versed in acoustics will discover wonderful illustrations and photographs depicting familiar concepts in new and enlightening ways.

Sounds All Around Susan Hughes,2021 Zzzzzzzz! It's a mosquito. Such a tiny insect, but its beating wings make such a BIG sound in the silence. Sound is a sense we often take for granted. Where does sound come from? Why are some sounds loud and some soft? Some high-pitched and some low-pitched? How do humans and animals use sound to communicate? What's the difference between natural and artificial sound? This lyrical picture book explores all of these questions, giving young children a charming and gentle introduction to how sound works.--

What's That Sound? Kristi Nielsen,2020-11-16 What's that Sound? Animal Sounds Every child quickly learns to associate sounds with things they are familiar with as they start to learn language. A two-year-old may frequently ask What's that Sound? when they hear something they do not recognize. They are also excited about learning to mimic the sounds of things they are familiar with. Repetition and mimicking is an important part of learning language. A child copies the sound a kitten makes, or the sound of a dog. Knowing how beneficial this process is for toddlers is the impetus for writing this book. The author's 23 month old grandson, asked What's that sound? so many times every day, a grandmother did what a grandmother does. She wrote and illustrated What's that Sound? Animal Sounds and What's that Sound? Transportation Sounds in response to his love for learning sounds. He quickly learned to make the sounds that correspond to various animals and transportation and construction equipment. His environment was filled with new sounds. His grandmother moved to a condo on a busy street and next door to his home a house was demolished and a new house was under construction. He, like most children at that stage of learning language, enjoyed learning the names the thing making the sound. Many times he could not see what was making the noise. For this reason a book supplies an opportunity to learn the vocabulary and phonetic expressions to match.
