Acoustic Communication in Animals Yoshimasa Seki, 2023-07-19 This book is the first volume of the bioacoustics series published by the Society for Bioacoustics. This volume provides an overview of the advances and recent topics in acoustic communication in various animals. Most animals produce vibrations and sounds by moving their body parts, including vocal organs. These sounds can be research targets of bioacoustics studies. How animals use these sounds, especially in inter-individual relationships, is the focus of this volume, "Acoustic Communication in Animals". The authors' expertise varies from molecular biology, neurobiology to psychology, and human brain imaging. Their research subjects range from invertebrates to humans. Despite the variety of topics, chapters are developed under the consideration of ethology and evolution. Readers will recognize the profundity of the topics in each chapter. In addition, the view and understanding of natural sound sequences produced by animals can vary among different cultures. Research from Japan and regions that have been underrepresented in previous literature can offer new ideas and unique perspectives in the study of bioacoustics. Readers can grasp the progress of this research field in a broad range of species in one book. The book presents multi- and interdisciplinary topics and appeals to researchers and students in fields including psychology, physiology, zoology, ethology, and neurosciences.

The Physiology of Insecta Morris Rockstein, 2013-10-22 The Physiology of Insecta, Second Edition, Volume II, is part of a multivolume treatise that brings together the known facts, the controversial material, and the many still unsolved and unsettled problems of insect physiology. Since the first edition of this multivolume treatise was published, there has been a notable expansion of scientific endeavor in each of the various aspects of insect physiology. The original three-volume work has now grown to a thoroughly revised six-volume treatise. The book contains nine chapters that focus on the impact of environmental factors on the physiology of insects. The first chapter discusses the influence of temperature on insects, with attention to aspects likely to be of significance in relation to the rate at which individuals are born and die in natural populations. Separate chapters follow on the effects of humidity and radiation. Subsequent chapters deal with insect chemoreception and mechanoreception; visual system, with a

focus on compound eyes; sound production and the behavior associated with it; luminous insects; and the role of internal circadian oscillations in the life of insects with respect to the day outside, and on the role of the circadian system in biological time measurement.

Mosquitopia Marcus Hall, Dan Tamir, 2021-09-01 This edited volume brings together natural scientists, social scientists and humanists to assess if (or how) we may begin to coexist harmoniously with the mosquito. The mosquito is humanity's deadliest animal, killing over a million people each year by transmitting malaria, yellow fever, Zika and several other diseases. Yet of the 3,500 species of mosquito on Earth, only a few dozen of them are really dangerous—so that the question arises as to whether humans and their mosquito foe can learn to live peacefully with one another. Chapters assess polarizing arguments for conserving and preserving mosquitoes, as well as for controlling and killing them, elaborating on possible consequences of both strategies. This book provides informed answers to the dual question: could we eliminate mosquitoes, and should we? Offering insights spanning the technical to the philosophical, this is the “go to” book for exploring humanity's many relationships with the mosquito—which becomes a journey to finding better ways to inhabit the natural world. *Mosquitopia* will be of interest to anyone wanting to explore dependencies between human health and natural systems, while offering novel perspectives to health planners, medical experts, environmentalists and animal rights advocates. Testing Hearing Alexandra Hui, Mara Mills, Viktoria Tkaczyk, 2020 *Testing Hearing: The Making of Modern Aurality* argues that the modern cultural practices of hearing and testing have emerged from a long interrelationship. Since the early nineteenth century, auditory test tools (whether organ pipes or electronic tone generators) and the results of hearing tests have fed back into instrument calibration, human training, architecture, and the creation of new musical sounds. Hearing tests received a further boost around 1900 as a result of injury compensation laws and state and professional demands for aptitude testing in schools, conservatories, the military, and other fields. Applied at large scale, tests of seemingly small measure-of auditory acuity, of hearing range-helped redefine the modern concept of hearing as such. During the twentieth and twenty-first centuries, the epistemic function of hearing expanded. Hearing took on the dual role of test object and test instrument; in the latter case, human hearing became a gauge by which to evaluate or regulate materials, nonhuman organisms, equipment, and technological systems. This book considers both the testing of hearing and testing with hearing to explore the co-creation of modern epistemic and auditory cultures. The book's twelve contributors trace the design of ever more specific tests for the arts, education and communication, colonial and military applications, sociopolitical and industrial endeavors. Together, they demonstrate that testing as such became an enduring and wide-ranging cultural technique in the modern period, one that is situated between histories of scientific experimentation and many fields of application.

Courtship and Mate-finding in Insects Raymond J.C. Cannon, 2023-06-30 This book explores mate-finding and courtship behaviour in the insect world, in all its subtlety and diversity. Insects engage in courtship as much, or as little, as any other animal; they have songs and dances, and all manner of instruments and ornaments to attract and court the opposite sex. Insects have evolved complex chemical and acoustic communication systems, sending fragrant messages, visual signals and subtle vibrations to attract and persuade. Insects also have many different ways and means of choosing or rejecting mating partners. This beautifully illustrated book shows the incredible variety of courtship behaviours and celebrates the wonderful natural history of a wide range of insects. Varieties of courtship can occur before, during and even after copulation, and numerous examples

of the different mating strategies used are presented. This landmark volume will be of interest to students of biology, entomologists, naturalists and anyone with a desire to know more about the love lives of the small creatures with which we share the planet.

Natural Physical Sources of Underwater Sound B.R. Kerman, 2012-12-06 To place this book in perspective it is useful for the reader to be aware of the recent history of the topic of underwater sound generation at the ocean surface by natural mechanisms. A meeting in Lerici, Italy in 1987 was convened within the NATO Advanced Research Workshop series, to bring together underwater acousticians and ocean hydrodynamicists to examine various mechanisms which generate sound naturally at the ocean surface. A record of that meeting was published in the NATO scientific publication series in 1988 under the title 'Sea Surface Sound'. That meeting was successful in inspiring and coordinating both participants and non-attending colleagues to examine some key issues which were raised during the course of presentations and discussions. The understanding among those present was that another meeting should be convened 3 years hence to report and review progress in the subject. Accordingly the second conference was convened in Cambridge in 1990, whose proceedings are presented here. This volume represents a very gratifying increase in only a 3 year interval in our understanding of a number of physical processes which generate sound at the peripheries of oceans. In fact it represents both the acceleration of singular effort as well as the development of interdisciplinary sophistication and co-operation. The enthusiasm, goodwill, and intense scientific curiosity which characterized the Lerici meeting carried through to Cambridge. The collegial atmosphere established by the participants was perfectly timed to foster another major advance in studies of ocean surface sound.

Mosquito Research Henry Puerta-Guardo, Pablo Manrique-Saide, 2023-01-04 With around 3,500 species identified so far, mosquitoes can be found in virtually every environment and continent around the globe. Blood-feeding biters (e.g., Anopheles, Culex, Aedes, Ochlerotatus, and Mansonia) are among the most influential vectors for harboring and transmitting mosquito-borne diseases (MBDs) such as Zika, Japanese encephalitis, West Nile fever, dengue fever, yellow fever, and malaria, among other diseases. More than 700 million human infections and 725,000 deaths occur every year. Mosquitoes are increasing in number worldwide, yet there are still no effective vaccines or prevention strategies. Thus, traditional vector control strategies remain the most common ways to combat these diseases. Despite this, MBDs linger as one of the major challenges for public health and vector control programs at both global and local levels. This book provides a comprehensive overview of MBDs and vector control strategies.

Mosquito Hunters (A history of hostilities against man's deadliest foe - the mosquito - since 1881) B. K. Tyagi, 2021-01-12 The book also tells the story of some of the mosquito species that contribute to human diseases such as malaria, filariasis, dengue, Zika, chikungunya, and Japanese encephalitis. These diseases have played an important role in slowing down the national progress through depleted economy, health and intelligence. The country spends almost 50% of its health budget in fighting against these ailments. Therefore, it emerges that, besides the brutal facts of how the mosquito has insinuated itself into human history, from the malaria that devastated invaders of ancient Rome (Alexander 'The Great' had reportedly died due to Plasmodium falciparum malaria while returning home after the battle with the Indian king Poru in the malaria infested Punjab region), the story of man's struggle to live with the mosquito, from the early 19th Century malaria-defeat in Mian Mir under direct charge of Dr Samuel Rickard Christophers, who advocated to Dr Ronald Ross's theory of 'environment sanitation', to the malaria-deaths of hundreds of rural inhabitants living in The Thar Desert's irrigated Command Area under the world famous Indira Gandhi Nahar Pariyojana, in the early 1990s, and to the recent panic over the chikungunya virus' in Kerala, as well as many other States and Union Territories, crippling thousands of people, in 2006, and deaths from dengue all over the country during 2012-14, need to be told to the modern generation of medical entomologists and vector-borne disease specialists to relive the moments of victories and defeats in this vicious age-old battle between man and mosquito. At the end we find that we have only ourselves to be blamed to a great extent for accelerating the spread of mosquitoes and the diseases they transmit; with climate change and increased international travel, mosquito-borne illnesses are flaring up all over the globe. Catastrophic failures of mosquito control have ensured that worldwide even now one person dies of malaria every twelve seconds. This book describes, in a mosquito's-eye view, how mosquito breeds, rests, feeds, flies, mate, and dies, besides interaction with her natural enemies. The book also deals with the current constraints and future control prospects of mosquito control. In view of the increasing resistance to insecticides and chemotherapy, the book throws light on the subject of greatest promise to ending mosquitoes' deadly assault on man by rendering them impotent by genetic manipulation by replacing them through paratransgenesis involving micro-organisms such as bacteria and fungi.
