Passive Altimeter Study Using GPS Flight Data (Preprint), 2003 Software GPS receiver results are presented for an over-land, passive altimeter application utilizing GPS signals. The flight data were collected using a DC-3 aircraft operated by Ohio University. The flight took place over southeast Ohio, where the terrain is hilly and forested. The GPS receiver on board the aircraft contains two channels. One channel has a right-hand-circular-polarized antenna facing upward, and the second has a left-hand-circular-polarized antenna facing downward. The upward antenna primarily receives the GPS direct signals, while the downward antenna primarily receives the ground-reflected GPS signals. Software radio GPS algorithms are used to process the data received from the upward channel. The information obtained after processing includes receiver position data, visible satellites, C/A code delay, Doppler frequency and navigation data bits as functions of time. This information is used to generate a reference signal to correlate the data received from the downward channel. Since the Doppler shift can be different between the reference and the reflected signals, the length of the coherent integration time is limited. Furthermore, the Doppler shift of the reflected signal can change rapidly as a function of the terrain. Therefore, a combination of coherent and noncoherent integration is used to enhance the signal-to-noise ratio of the reflected signals. The correlation result shows a C/A code delay corresponding to the path length difference between the direct and reflected signals. From the known locations of the receiver and the satellites, the height above ground of the receiver can be calculated. The flight data cover heights ranging from 0 to 3000 meters above the terrain.

The Future of Spaceborne Altimetry Chester John Koblinsky,P. Gaspar,Gary S. E. Lagerloef,1992

Wilderness Navigation Handbook Fred Touche,2005-09-28 Designed for both land and water use, this comprehensive guide helps unlock the complexity of map and chart reading as it relates to navigation. Beginning with detailed technical descriptions of the tools of navigation—a compass, an altimeter, a GPS system, and a sextant—this handbook shows how to use these tools either individually or in combination with each other to navigate any area. Factors that cause tools and techniques to fail are discussed, such as why an altimeter often shows the wrong elevation, a GPS position is sometimes off track, and the sun often points in an unexpected direction. Twenty-one real-life scenarios provide practical wisdom for even the most intrepid navigator. Specific information on using the moon for directions and the stars for position, measuring boiling water temperature for elevation, map projections, map datums, great circle routes, and the UTM/UPS grid system is included.

Observation of the Earth and its Environment Herbert J. Kramer,2013-03-09 The following listing represents a survey and a short description of 'Earth Observing Missions' in alphabetical order. The listing in Part A considers completed-, operational-as well as planned missions on an international scale (Earth observations from space know no national boundaries). A look into past activities is important for reasons of heritage, context and of perspective. The document is intended for all who want to keep track of missions and sensors in the fast -growing field of Earth observations. There cannot be any claim to completeness, although a considerable effort was made to collect and integrate all known missions and sensors into this book. Earth observation by remote sensing changes our view and perception of the world. We begin to realize the global character of remote sensing, its multidimensional and complementary nature, its vast potential to many disciplines, its importance to mankind as a whole. Remote sensing permits for the first time in history a total system view of the Earth. The view from space toward Earth has brought about sweeping revisions in the

Earth sciences, in particular in such fields as meteorology, oceanology, hydrology, geology, geography, forestry, agriculture, geodynamics, solar-terrestrial interactions, and many others.
