Crs Report for Congress Congressional Research Service: The Libr,Wayne A. Morrissey,2013-11 Some in Congress are concerned about the possible vulnerability of U.S. coastal areas to tsunamis and about the adequacy of early warning for coastal areas of the western Atlantic Ocean. This stems from the December 26, 2004, tsunami that devastated many coastal areas around the northern Indian Ocean, where few tsunami early warning systems currently operate. Caused by a strong underwater earthquake off the coast of Sumatra, Indonesia, the earthquake and ensuing tsunami together are estimated to have claimed as many as 300,000 lives. Affected nations, assisted by others, are pursuing multilateral efforts through the UNESCO's Intergovernmental Oceanographic Commission (IOC) to develop a regional tsunami detection and warning network to alert coastal populations around the Indian Ocean. Those efforts coincide with President Bush's plan for upgrading and expanding U.S. tsunami detection and early warning capabilities, which was released in December 2005. Some developed countries bounded by the Indian Ocean already have operating tsunami warnings systems. However, in some areas of these and in neighboring countries, there is no emergency management infrastructure to receive tsunami warnings. Local officials are incapable of rapidly alerting the public to evacuate or to take other safety precautions. However, most disaster management experts assert that an ...

Tsunamis Horace M. Karling,2005 The phenomenon called a 'tsunami' (soo-NAHmee) is a series of travelling ocean waves of extremely long length generated primarily by earthquakes occurring below or near the ocean floor. Underwater volcanic eruptions and landslides can also generate tsunamis. In the deep ocean, the tsunami waves propagate across the deep ocean with a speed exceeding 800 kilometres per hour (km, 500 miles per hour), and a wave height of only a few tens of centimetres (1 foot) or less. Tsunami waves are distinguished from ordinary ocean waves by their great length between wave crests, often exceeding a 100 km (60 miles) or more in the deep ocean, and by the time between these crests, ranging from 10 minutes to an hour. As they reach the shallow waters of the coast, the waves slow down and the water can pile up into a wall of destruction tens of meters (30 ft) or more in height. The effect can be amplified where a bay, harbour or lagoon funnels the wave as it moves inland. Large tsunamis have been known to rise over 30 meters (100 ft). Even a tsunami 3-6 meters (m) high can be very destructive and cause many deaths and injuries. near the ocean. During the 1990s, over 4,000 people were killed by 10 tsunamis, including more than 1000 lives lost in the 1992 Flores region, Indonesia, and 2200 lives in the 1998 Aitape, Papua New Guinea tsunamis. Property damage was nearly one billion United States (US) dollars. Although 80 per cent of the tsunamis occur in the Pacific, they can also threaten coastlines of countries in other regions, including the Indian Ocean, Mediterranean Sea, Caribbean region, and even the Atlantic Ocean.

Tsunami Alert Oakley Brooks,2011-08-15 After the 2004 Asian Tsunami wiped out whole communities on the Indian Ocean, Indonesia's West Sumatra province learnt a startling reality—they were next. A loosely allied bunch of scientists, students and ordinary citizens struggle to make sense of this suddenly precarious location, centering on the area capital of Padang and hurrying together a plan to save it before it's too late. But the limits of

their grassroots activism in a crowded, striving, ill-planned city has critical implications for some of Asia’s other cities facing their own geological and climate time bombs. Smaller, more nimble places may be able to thrive in the coming century of environmental reckoning.

Tsunami Threat to California: Findings & Recommendations on Tsunami Hazards & Risks by the State of California Seismic Safety Commission , Caribbean Tsunami Hazard - Proceedings Of The Nsf Caribbean Tsunami Workshop Aurelio Mercado-irizarry,Philip L-f Liu,2006-02-08 This book aims to present the overall existing tsunami hazard in the Caribbean Sea region, a region which is typically only associated with hurricanes. It initially presents an overview of all of the existing tsunami-causing factors found in the region: earthquakes, sub-aerial and submarine landslides, and submarine explosions. This is followed by field evidence of recent and pre-historic tsunami events, which gives credibility to all of this effort. The next section is a description of the tsunami hazard mitigation efforts being carried out locally and in collaboration with national and international programs. The final part is dedicated to the presentation of related recent research results.
