Traffic and Transport Psychology Geoffrey Underwood,2005-06-09 Just as our transport systems become more and more important to our economic and social well-being, so they become more and more crowded and more at risk from congestion, disruption, and collapse. Technology and engineering can provide part of the solution, but the complete solution will need to take account of

the behaviour of the users of the transport networks. The role of psychologists in this is to understand how people make decisions about the alternative modes of transport and about the alternative routes to their destinations, to understand how novice and other vulnerable users can develop safe and effective behaviours, how competent users can operate within the transport system optimally and within their perceptual and cognitive limitations. The contributions to this volume address these issues of how the use of our transport systems can be improved by taking into account knowledge of the behaviour of the people who use the systems. Topics discussed include driver training and licensing, driver impairment, road user attitudes and behaviour, enforcement and behaviour change, driver support systems, and the psychology of mobility and transport mode choice. This work will be of value not only to psychologists but to all transport professionals interested in the application of psychology to traffic.

Trajectory Planning of an Autonomous Vehicle in Multi-Vehicle Traffic Scenarios Mahdi Morsali, 2021-03-25 Tremendous industrial and academic

progress and investments have been made in autonomous driving, but still many aspects are unknown and require further investigation, development and testing. A key part of an autonomous driving system is an efficient planning algorithm with potential to reduce accidents, or even unpleasant and stressful driving experience. A higher degree of automated planning also makes it possible to have a better energy management strategy with improved performance through analysis of surrounding environment of autonomous vehicles and taking action in a timely manner. This thesis deals with planning of autonomous vehicles in different urban scenarios, road, and vehicle conditions. The main concerns in designing the planning algorithms, are real-time capability, safety and comfort. The planning algorithms developed in this thesis are tested in simulation traffic situations with multiple moving vehicles as obstacles. The research conducted in this thesis falls mainly into two parts, the first part investigates decoupled trajectory planning algorithms with a focus on speed planning, and the second section explores different coupled planning algorithms in spatiotemporal environments where path and speed are calculated simultaneously. Additionally, a behavioral analysis is carried out to evaluate different tactical maneuvers the autonomous vehicle can have considering the initial states of the ego and surrounding vehicles. Particularly relevant for heavy duty vehicles, the issues addressed in designing a safe speed planner in the first part are road conditions such as banking, friction, road curvature and vehicle

characteristics. The vehicle constraints on acceleration, jerk, steering, steer ratelimitations and other safety limitations such as rollover are further considerations in speedplanning algorithms. For real time purposes, a minimum working roll model is identified us-ing roll angle and lateral acceleration data collected in a heavy duty truck. In the decoupledplanners, collision avoiding is treated using a search and optimization based planner. In an autonomous vehicle, the structure of the road network is known to the vehicle throughmapping applications. Therefore, this key property can be used in planning algorithms toincrease efficiency. The second part of the thesis, is focused on handling moving obstaclesin a spatiotemporal environment and collision-free planning in complex urban structures.Spatiotemporal planning holds the benefits of exhaustive search and has advantages com-pared to decoupled planning, but the search space in spatiotemporal planning is complex.Support vector machine is used to simplify the search problem to make it more efficient.A SVM classifies the surrounding obstacles into two categories and efficiently calculate anobstacle free region for the ego vehicle. The formulation achieved by solving SVM, con-tains information about the initial point, destination, stationary and moving obstacles.These features, combined with smoothness property of the Gaussian kernel used in SVMformulation is proven to be able to solve complex planning missions in a safe way. Here, three algorithms are developed by taking advantages of SVM formulation, a greedysearch algorithm, an A* lattice based planner and a

geometrical based planner. One general property used in all three algorithms is reduced search space through using SVM. In A* lattice based planner, significant improvement in calculation time, is achieved by using the information from SVM formulation to calculate a heuristic for planning. Using this heuristic, the planning algorithm treats a simple driving scenario and a complex urban structure equal, as the structure of the road network is included in SVM solution. Inspired by observing significant improvements in calculation time using SVM heuristic and combining the collision information from SVM surfaces and smoothness property, a geometrical planner is proposed that leads to further improvements in calculation time. Realistic driving scenarios such as roundabouts, intersections and takeover maneuvers are used, to test the performance of the proposed algorithms in simulation. Different road conditions with large banking, low friction and high curvature, and vehicles prone to safety issues, specially rollover, are evaluated to calculate the speed profile limits. The trajectories achieved by the proposed algorithms are compared to profiles calculated by optimal control solutions.
