Molecular Neuroendocrinology David Murphy,Harold Gainer,2016-01-19 Molecular Neuroendocrinology: From Genome to Physiology, provides researchers and students with a critical examination of the steps being taken to decipher genome complexity in the context of the expression, regulation and physiological functions of genes in neuroendocrine systems. The 19 chapters are divided into four sectors: A) describes and explores the genome, its evolution, expression and the mechanisms that contribute to protein, and hence biological, diversity. B) discusses the mechanisms that enhance peptide and protein diversity beyond what is encoded in the genome through post-translational modification. C) considers the molecular tools that today's neuroendocrinologists can use to study the regulation and function of neuroendocrine genes within the context of the intact organism. D) presents a range of case studies that exemplify the state-of-the-art application of genomic technologies in physiological and behavioural experiments that seek to better understand complex biological processes. • Written by a team of internationally renowned researchers • Both print and enhanced e-book versions are available • Illustrated in full colour throughout This is the third volume in a new Series 'Masterclass in Neuroendocrinology' , a co-publication between Wiley and the INF (International Neuroendocrine Federation) that aims to illustrate highest standards and encourage the use of the latest technologies in basic and clinical research and hopes to provide inspiration for further exploration into the exciting field of neuroendocrinology. **Moving Beyond Self-Interest** Stephanie L. Brown,R. Michael Brown,Louis A. Penner,2011-10-26 Moving Beyond Self-Interest is an interdisciplinary volume that discusses cutting-edge developments in the science of caring for and helping others. In Part I, contributors raise foundational issues related to human caregiving. They present new theories and data to show how natural selection might have shaped a genuinely altruistic drive to benefit others, how this drive intersects with the attachment and caregiving systems, and how it emerges from a broader social engagement system made possible by symbiotic regulation of autonomic physiological states. In Part II, contributors propose a new neurophysiological model of the human caregiving system and present arguments and evidence to show how mammalian neural circuitry that supports parenting might be recruited to direct human cooperation and competition, human empathy, and parental and romantic love. Part III is devoted to the psychology of human caregiving. Some contributors in this section show how an evolutionary perspective helps us better understand parental investment in and empathic concern for children at risk for, or suffering from, various health, behavioral, and cognitive problems. Other contributors identify circumstances that differentially predict caregiver benefits and costs, and raise the question of whether extreme levels of compassion are actually pathological. The section concludes with a discussion of semantic and conceptual obstacles to the scientific investigation of caregiving. Part IV focuses on possible interfaces between new models of caregiving motivation and economics, political science, and social policy development. In this section, contributors show how the new theory and research discussed in this volume can inform our understanding of economic utility, policies for delivering

social services (such as health care and education), and hypotheses concerning the origins and development of human society, including some of its more problematic features of nationalism, conflict, and war. The chapters in this volume help readers appreciate the human capacity for engaging in altruistic acts, on both a small and large scale.

**Mechanisms of Life History Evolution** Thomas Flatt, Andreas Heyland, 2011-05-12 This interdisciplinary volume unites evolutionary and molecular biologists from various fields (life history theory, molecular biology, developmental biology, aging, phenotypic plasticity, social behaviour, and endocrinology) who use studies of molecular mechanisms to solve fundamental questions in life history evolution in a variety of organisms.

***Evolution of Nervous Systems*** Georg F. Striedter, Theodore H. Bullock, Todd M. Preuss, John Rubenstein, Leah A. Krubitzer, 2016-11-23 Evolution of Nervous Systems, Second Edition, Four Volume Set is a unique, major reference which offers the gold standard for those interested both in evolution and nervous systems. All biology only makes sense when seen in the light of evolution, and this is especially true for the nervous system. All animals have nervous systems that mediate their behaviors, many of them species specific, yet these nervous systems all evolved from the simple nervous system of a common ancestor. To understand these nervous systems, we need to know how they vary and how this variation emerged in evolution. In the first edition of this important reference work, over 100 distinguished neuroscientists assembled the current state-of-the-art knowledge on how nervous systems have evolved throughout the animal kingdom. This second edition remains rich in detail and broad in scope, outlining the changes in brain and nervous system organization that occurred from the first invertebrates and vertebrates, to present day fishes, reptiles, birds, mammals, and especially primates, including humans. The book also includes wholly new content, fully updating the chapters in the previous edition and offering brand new content on current developments in the field. Each of the volumes has been carefully restructured to offer expanded coverage of non-mammalian taxa, mammals, primates, and the human nervous system. The basic principles of brain evolution are discussed, as are mechanisms of change. The reader can select from chapters on highly specific topics or those that provide an overview of current thinking and approaches, making this an indispensable work for students and researchers alike. Presents a broad range of topics, ranging from genetic control of development in invertebrates, to human cognition, offering a one-stop resource for the evolution of nervous systems throughout the animal kingdom Incorporates the expertise of over 100 outstanding investigators who provide their conclusions in the context of the latest experimental results Presents areas of

disagreement and consensus views that provide a holistic view of the subjects under discussion

**The Oxford Handbook of Evolutionary Family Psychology** Catherine Salmon, Todd K. Shackelford, 2011-05-27 The Oxford Handbook of Evolutionary Family Psychology focuses on the psychology behind people's familial behavior, an understanding of which can illuminate our understanding of modern, ancient, and animal families.

**Human Evolutionary Biology** Michael P. Muehlenbein, 2010-07-29 Wide-ranging and inclusive, this text provides an invaluable review of an expansive selection of topics in human evolution, variation and adaptability for professionals and students in biological anthropology, evolutionary biology, medical sciences and psychology. The chapters are organized around four broad themes, with sections devoted to phenotypic and genetic variation within and between human populations, reproductive physiology and behavior, growth and development, and human health from evolutionary and ecological perspectives. An introductory section provides readers with the historical, theoretical and methodological foundations needed to understand the more complex ideas presented later. Two hundred discussion questions provide starting points for class debate and assignments to test student understanding.

**Advances in Vasopressin and Oxytocin - From Genes to Behaviour to Disease** Rainer Landgraf, Inga D. Neumann, 2008-09-10 Vasopressin and oxytocin are the key hormones of the hypothalamo-neurohypophyseal system, and are well-known to be critically involved in antidiuresis, labor, and milk ejection. This book highlights the latest research on vasopressin and oxytocin, covering multiple biological aspects. The capacity of both hormones to regulate various aspects of social behaviours including pair-bonding, aggression, maternal love, and sexual behaviour, is a main focus, as are their interactions with a variety of other neuromodulators and transmitters. Moreover, the book illustrates the recent development of vasopressin and oxytocin agonists/antagonists as potential drugs to treat not only disturbances of body fluid homeostasis, but also mental disorders, including social phobia, autism, anxiety, and depression. The promising combination of basic and clinical research, comprising physiology, neuroendocrinology, behavioral biology, pharmacology, imaging and molecular genetics makes this book an essential addition to both experts and scientists new to the field alike. • Comprehensive review of OXT and AVP physiology and behaviour • Each chapter covers a novel aspect of OXT and AVP research and is written by a leading expert • Review articles are ideal for experts and newcomers to the field alike • Discusses fascinating behavioural effects of oxytocin and vasopressin • Summarizes the recent explosion of neuropeptide research, physiology and behaviour, in one location

**Vertebrate Endocrinology** David Norris, James A. Carr, 2013-05-04 Vertebrate Endocrinology represents more than just a treatment of the endocrine system-it integrates hormones with other chemical bioregulatory agents not classically included with the endocrine system. It provides a complete overview of the endocrine system of vertebrates by first emphasizing the mammalian system as the basis of most terminology and

understanding of endocrine mechanisms and then applies that to non-mammals. The serious reader will gain both an understanding of the intricate relationships among all of the body systems and their regulation by hormones and other bioregulators, but also a sense of their development through evolutionary time as well as the roles of hormones at different stages of an animal's life cycle. Includes new full color format includes over 450 full color, completely redrawn image Features a companion web site hosting all images from the book as PPT slides and .jpeg files Presents completely updated and revitalized content with new chapters, such as Endocrine Disrupters and Behavioral Endocrinology Offers new clinical correlation vignettes throughout

**Fundamentals of Comparative Vertebrate Endocrinology** I. Chester-Jones, P.M. Ingleton, J.G. Phillips, 2013-12-14 Endocrinology, as a discipline, was a late arrival in the corpus of established subjects. Its growth in recent years has been prodigious, extending from morphology to molecular levels. Most of the major endocrine glands were noted by the early anatomists, although the adrenal glands were not described until 1563 by Bartholomaeus Eustachius (1520-1574). On the other hand, elucidation of the function of these glands was extremely slow. Key work by A. A. Berthold (1849), although overlooked at the time, showed that comb atrophy in castrated fowl was prevented by testis transplantation. The idea that glands produced substances reaching the bloodstream directly and not via excretory ducts stemmed from Claude Bernard, who first used the term internal secretion in 1855. The clinical observations of Thomas Addison at Guy's Hospital-published as a monograph in 1855 entitled *The Constitutional and Local Effects of Disease of the Suprarenal Capsules* -were seminal. However, the stimulus of this early research did not bring immediate widespread further investigations. Upon the discovery of secretin in 1902, Bayliss and Starling considered the term internal secretion to be clumsy, and the term hormone was coined (from OQ[!UW-1 excite or arouse) and it was first used by Starling in his Croonian of 1905.

*Oxytocin, Vasopressin and Related Peptides in the Regulation of Behavior* Elena Choleris, Donald W. Pfaff, Martin Kavaliers, 2013-04-11 The mammalian neurohypophyseal peptide hormones oxytocin and vasopressin act to mediate human social behavior - they affect trust and social relationships and have an influence on avoidance responses. Describing the evolutionary roots of the effects that these neuropeptides have on behavior, this book examines remarkable parallel findings in both humans and non-human animals. The chapters are structured around three key issues: the molecular and neurohormonal mechanisms of peptides; phylogenetic considerations of their role in vertebrates; and their related effects on human behavior, social cognition and clinical applications involving psychiatric disorders such as autism. A final chapter summarizes current research perspectives and reflects on the outlook for future developments. Providing a comparative overview and featuring contributions from leading researchers, this is a valuable resource for graduate students, researchers and clinicians in this rapidly developing field.

*Hormonal Signaling in Biology and Medicine* Gerald Litwack, 2019-10-24 Hormonal Signaling in Biology and Medicine: Comprehensive Modern Endocrinology covers the endocrine secretions produced by every organ. This extensive collection of knowledge is organized by tissue, addressing how certain hormones are synthesized in multiple tissues, along with their structure, function and pathways, which are very applicable for researchers in drug design who need to focus on a specific step along the pathway. This is a must have reference for researchers in endocrinology and practicing endocrinologists, but it is also ideal for biochemists, pharmacologists, biologists and students. Serves as a valuable desk reference for researchers Provides information on the structure of a given hormone, its receptor(s), and the pathways that become activated Includes extensive citations to the literature that will enable the reader to dig more deeply into the effects of a given hormone

*Aliens vs. Predators: Rift War* Weston Ochse,Yvonne Navarro,2022-08-16 When the Predators choose LV-363 for a hunt and seed it with Xenomorph eggs, the result is bizarre alien hybrids and humans trapped between the Predators and their prey. The planet LV-363 teems with exotic life, including a plant growing in the shadows of its deep rifts. The plant's flower yields a valuable narcotic, and people are forced by the cartels to harvest it. When a Yautja (Predator) ship arrives for a hunting ritual, the Predators seed the rifts with Xenomorph eggs. The aliens emerge and the result is bizarre and deadly hybrids, with humans trapped between the Predators and their prey. These deadly Xenomorph hybrids—some of which possess the ability to fly—swarm out of control and may prove more than either the Yautja or the humans can defeat. © 2021 20TH CENTURY STUDIOS
