Susan Whittemore, M D Texas Heart Institute Clinical Susan Whittemore Introduction by Denton a Cooley

**Regulation of Tissue Oxygenation, Second Edition** Roland N. Pittman, 2016-08-18 This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or  $P_{O_2}$  on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical  $P_{O_2}$ . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.

Arteries and Veins. The Difference in the Composition of Blood Peter Banda,2017-09-11 Essay from the year 2015 in the subject Medicine - General, grade: 75.5, , language: English, abstract: This essay seeks to examine the differences in the composition of blood carried by veins and arteries. An artery is a vessel that carries blood away from the heart and toward other tissues and organs. Arteries are part of the circulatory system, which delivers oxygen and nutrients to every cell of the body. They transport blood rich in oxygen to the organs of the body. Veins afterwards transport the deoxygenated and thus darker blood from parts of our body back to the heart. For many medical applications it would be of great benefit, if the vessels could be distinguished into arteries and veins, since there are many diseases with one symptom being an abnormal ratio of the size of arteries to veins. For example, in diabetic patients the veins are abnormally wide, while diseases of the pancreas lead to narrowed arteries and high blood pressure results in thickened arteries.

Readers follow a red blood cell on its journey through the body, and in the process learn how the body combats disease, performs gas exchanges, and

fight plaque.
