Hidden Histories: A Spotter's Guide to the British Landscape Mary-Ann Ochota, 2018-04-05 For the times when you're driving past a lumpy, bumpy field and you wonder what made the lumps and bumps; for when you're walking between two lines of grand trees, wondering when and why they were planted; for when you see a brown heritage sign pointing to a 'tumulus' but you don't know what to look for... Entertaining and factually rigorous, Hidden Histories will help you decipher the story of our landscape through the features you can see around you. This Spotter's Guide arms the amateur explorer with the crucial information needed to 'read' the landscape and spot the human activities that have shaped our green and pleasant land. Geophysical Data in Archaeology Armin Schmidt,2013-03-07 Anyone who has tried to archive archaeological geophysics data will have wondered what might be the most comprehensive and practical approach. This question is addressed by this Guide's extensively revised 2nd edition, which systematically explores what should be included in an Archive, illustrated with relevant examples. A conceptual framework is developed that allows assembling data and meta-data so that they can be deposited with an Archiving Body. This framework is also mapped onto typical database structures, including OASIS and the English Heritage Geophysics Database. Examples show step-by step how an Archive can be compiled for deposition so that readers will be able to enhance their own archiving practice. Geophysical data are sometimes the only remaining record of buried archaeological features when these are destroyed during commercial developments (e.g. road schemes). To preserve them in an Archive can therefore be essential. However, it is important that data are made available in formats that can still be read in years to come, accompanied by documentation that gives meaningful archaeological context. This Guide covers the creation of the necessary metadata and data documentation. There is no point preserving data if they cannot be used again; therefore this Guide is essential for anyone using geophysical data.

Surveying for Engineers John Uren,Bill Price,2018-03-13 The fifth edition of this classic textbook sets out the essential techniques needed for a solid grounding in the surveying. The popular and trusted textbook covers the traditional topics such as levelling, measurement of angles, measuring distances, and how to carry out traversing and compute coordinates, as well as the latest technological advances. It is packed with clear illustrations, exercises and worked examples, making it both a comprehensive study aid for students and a reliable reference tool for practitioners. This text is aimed at students studying surveying as either part of a civil engineering, building or construction course or as a separate discipline. It is also useful for students who undertake surveying as an elective subject and is a useful resource for practising surveyors. New to this Edition: - The latest developments in Global Navigation Satellite Systems (GNSS) particularly the introduction of network RTK and OS Net and their applications - Recent developments in survey instruments, methods and digital technologies including image processing with total stations and laser planners, developments in data processing and integration and updates on Ordnance Survey mapping products

Estuarine and Coastal Hydrography and Sediment Transport R. J. Uncles,S. B. Mitchell,2017-08-17 A practical guide to the latest techniques to measure sediments, seabed, water and transport mechanisms in estuaries and coastal waters. Covering a broad range of topics, enough background is included to explain how each technology functions. Practical Geodesy Maarten Hooijberg,2012-12-06 Written for geodesists using computers of modest capacity, the book reviews the latest development in geodetic computation techniques. The aim is to take stock of available data (datums, ellipsoids, units etc.), to focus on applications and to illuminate spatial developments. Topics cover datums and reference systems, geodetic arc distances, different projections and coordinate systems. The material has been specially chosen and covers the practical aspect of geodesy, including the demonstration of global examples. Stressing the how-to-do approach, the book is of interest to

students in geodesy, GIS consultants, hydrographers and land surveyors.

Engineering Surveying W Schofield, Mark Breach, 2007-02-14 Engineering surveying involves determining the position of natural and man-made features on or beneath the Earth's surface and utilizing these features in the planning, design and construction of works. It is a critical part of any engineering project. Without an accurate understanding of the size, shape and nature of the site the project risks expensive and time-consuming errors or even catastrophic failure. This fully updated sixth edition of Engineering Surveying covers all the basic principles and practice of the fundamentals such as vertical control, distance, angles and position right through to the most modern technologies. It includes: * An introduction to geodesy to facilitate greater understanding of satellite systems * A fully updated chapter on GPS, GLONASS and GALILEO for satellite positioning in surveying * All new chapter on the important subject of rigorous estimation of control coordinates * Detailed material on mass data methods of photogrammetry and laser scanning and the role of inertial technology in them With many worked examples and illustrations of tools and techniques, it suits students and professionals alike involved in surveying, civil, structural and mining engineering, and related areas such as geography and mapping.

Policy Issues in Modern Cartography D.R.F. Taylor, 1998-10-16 Policy Issues in Modern Cartography contains the views of national mapping agencies, legal scholars, the library community, the private sector and academia on these and many other important issues. The book begins with perspectives from national mapping agencies in Britain, Canada and the United States followed by a survey of the situation in Asia. The next three chapters deal primarily with legal issues such as copyright and intellectual property from both North American and European perspectives. Chapter 8 presents an important perspective on the key issues by a representative of the private sector followed by six chapters written primarily by academics including an important contribution by a map librarian. The volume concludes with an assessment of the challenges remaining.

Geocomputation with R Robin Lovelace, Jakub Nowosad, Jannes Muenchow, 2019-03-22 Geocomputation with R is for people who want to analyze, visualize and model geographic data with open source software. It is based on R, a statistical programming language that has powerful data processing, visualization, and geospatial capabilities. The book equips you with the knowledge and skills to tackle a wide range of issues manifested in geographic data, including those with scientific, societal, and environmental implications. This book will interest people from many backgrounds, especially Geographic Information Systems (GIS) users interested in applying their domain-specific knowledge in a powerful open source language for data science, and R users interested in extending their skills to handle spatial data. The book is divided into three parts: (I) Foundations, aimed at getting you up-to-speed with geographic data in R, (II) extensions, which covers advanced techniques, and (III) applications to real-world problems. The chapters cover progressively more advanced topics, with early chapters providing strong foundations on which the later chapters build. Part I describes the nature of spatial datasets in R and methods for manipulating them. It also covers geographic data import/export and transforming coordinate reference systems. Part II represents methods that build on these foundations. It covers advanced map making (including web mapping), bridges to GIS, sharing reproducible code, and how to do cross-validation in the presence of spatial autocorrelation. Part III applies the knowledge gained to tackle real-world problems, including representing and modeling transport systems, finding optimal locations for stores or services, and ecological modeling. Exercises at the end of each chapter give you the skills needed to tackle a range of geospatial problems. Solutions for each chapter and supplementary materials providing extended examples are available at

<https://geocompr.github.io/geocompkg/articles/>. Dr. Robin Lovelace is a University Academic Fellow at the University of Leeds, where he has taught R for geographic research over many years, with a focus on transport systems. Dr. Jakub Nowosad is an Assistant Professor in the Department of Geoinformation at the Adam Mickiewicz University in Poznan, where his focus is on the analysis of large datasets to understand environmental processes. Dr. Jannes Muenchow is a Postdoctoral Researcher in the GIScience Department at the University of Jena, where he develops and teaches a range of geographic methods, with a focus on ecological modeling, statistical geocomputing, and predictive mapping. All three are active developers and work on a number of R packages, including stplanr, sabre, and RQGIS.

Continental Shelf Limits P. J. Cook,Chris Carleton,2000 Setting the scene, introduction, the United Nations convention o the law of the sea. Methodology, historical methods of positioning at sea. Establish the case, the practical realization of the continental shefl limit. Other issues, deep sea fan issues.

The Air Pilot's Guide to Satellite Positioning Systems Walter Blanchard,1995 The aim of this book is to describe how satnav systems are designed and work, especially from the aviation viewpoint, without getting too heavily involved in mathematics and electronic engineering. It does, however, assume some knowledge of elementary maths, physics and electronics, and a nodding acquaintance with navigational terminology. It is written for the satnav user who wishes to explore the subject more deeply than simply knowing which knob to twiddle, and also to provide technical background material for the increasing number of non-specialists having to deal with GNSS and its implementation.
