Creating Value with Big Data Analytics Peter C. Verhoef, Edwin Kooge, Natasha Walk, 2016-01-08

Our newly digital world is generating an almost unimaginable amount of data about all of us. Such a vast amount of data is useless without plans and strategies that are designed to cope with its size and complexity, and which enable organisations to leverage the information to create value. This book is a refreshingly practical, yet theoretically sound roadmap to leveraging big data and analytics. Creating Value with Big Data Analytics provides a nuanced view of big data development, arguing that big data in itself is not a revolution but an evolution of the increasing availability of data that has been observed in recent times. Building on the authors' extensive academic and practical knowledge, this book aims to provide managers and analysts with strategic directions and practical analytical solutions on how to create value from existing and new big data. By tying data and analytics to specific goals and processes for implementation, this is a much-needed book that will be essential reading for students and specialists of data analytics, marketing research, and customer relationship management.

Applied Probabilistic Calculus for Financial Engineering Bertram K. C. Chan, 2017-09-11 Illustrates how R may be used successfully to solve problems in quantitative finance. *Applied Probabilistic Calculus for Financial Engineering: An Introduction Using R* provides R recipes for asset allocation and portfolio optimization problems. It begins by introducing all the necessary probabilistic and statistical foundations, before moving on to topics related to asset allocation and portfolio optimization with R codes illustrated for various examples. This clear and concise book covers financial engineering, using R in data analysis, and univariate, bivariate, and multivariate data analysis. It examines probabilistic calculus for modeling financial engineering—walking the reader through building an effective financial model from the Geometric Brownian Motion (GBM) Model via probabilistic calculus, while also covering Ito Calculus. Classical mathematical models in financial engineering and modern portfolio theory are discussed—along with the Two Mutual Fund Theorem and The Sharpe Ratio. The book also looks at R as a calculator and using R in data analysis in financial engineering. Additionally, it covers asset allocation using R, financial risk modeling and portfolio optimization using R, global and local optimal

values, locating functional maxima and minima, and portfolio optimization by performance analytics in CRAN. Covers optimization methodologies in probabilistic calculus for financial engineering Answers the question: What does a Random Walk Financial Theory look like? Covers the GBM Model and the Random Walk Model Examines modern theories of portfolio optimization, including The Markowitz Model of Modern Portfolio Theory (MPT), The Black-Litterman Model, and The Black-Scholes Option Pricing Model Applied Probabilistic Calculus for Financial Engineering: An Introduction Using R s an ideal reference for professionals and students in economics, econometrics, and finance, as well as for financial investment quants and financial engineers.

The Regulation of Monopoly Roger Sherman, 1989-03-31 Competition may not function well where technology calls for large and complex investments, as in the electricity industry where public utilities often provide service. This book presents economic welfare foundations for the purpose of evaluating how well, from a social point of view, an enterprise performs when competition is unable to function. Problems with existing institutions are emphasized. Topics treated include welfare measures and their

uses in peak-load pricing, second-best pricing, and income distribution. Professor Sherman covers public choice difficulties of government intervention, and describes problems with incentives in statutory monopolies and efforts to overcome them through the study of principal-agent relationships. Contestability and sustainable prices are also discussed, as well as effects of uncertainty and imperfect information.

General Biology II Dennis Holley, 2017-06-14 GENERAL BIOLOGY is an introductory level college biology textbook that provides students with an understandable and engaging encounter with the fundamentals of biology. Written for a two-semester undergraduate course of biology majors and presented as a bound set of two distinct volumes, this reader-friendly textbook(s) is concept driven vs. terminology driven. That is, the book(s) are based on the underlying concepts and principles of biology rather than the strict memorization of biological terms and terminology. Written in a student-centered and conversational style, this educational research-based book(s) connects students to all aspects of biology from the molecular to the biosphere. End-of-chapter questions challenge students to think

critically and creatively while incorporating science process skills and biological principles.

Handheld and Ubiquitous Computing Hans-W. Gellersen,1999-09-15 Truly personal handheld and wearable technologies should be small and unobtrusive and allow access to information and computing most of the time and in most circumstance. Complimentary, environment-based technologies make artifacts of our surrounding world computationally accessible and facilitate use of everyday environments as a ubiquitous computing interface. The International Symposium on Handheld and Ubiquitous Computing, held for the first time in September 1999, was initiated to investigate links and synergies in these developments, and to relate advances in personal technologies to those in environment-based technologies. The HUC 99 Symposium was organised by the University of Karlsruhe, in particular by the Telecooperation Office (TecO) of the Institute for Telematics, in close collaboration with ZKM Karlsruhe, which generously hosted the event in its truly inspiring Center for

Arts and Media Technology. The symposium was supported by the Association of Computing Machinery (ACM) and the German Computer Society (Gesellschaft für Informatik, GI) and held in cooperation with a number of special interest groups of these scientific societies. HUC 99 attracted a large number of paper submissions, from which the international programme committee selected 23 high-quality contributions for presentation at the symposium and for inclusion in these proceedings. In addition, posters were solicited to provide an outlet for novel ideas and late-breaking results; selected posters are also included with these proceedings. The technical programme was further complemented by four invited keynote addresses, and two panel sessions.

Integer Programming and Combinatorial Optimization Alberto Del Pia,Volker Kaibel,2023-05-21

This book constitutes the refereed proceedings of the 24th International Conference on Integer Programming and Combinatorial Optimization, IPCO 2023, held in Madison, WI, USA, during June 21–23, 2023. The 33 full papers presented were carefully reviewed and selected from 119

submissions. IPCO is under the auspices of the Mathematical Optimization Society, and it is an important forum for presenting present recent developments in theory, computation, and applications. The scope of IPCO is viewed in a broad sense, to include algorithmic and structural results in integer programming and combinatorial optimization as well as revealing computational studies and novel applications of discrete optimization to practical problems.

Local Telephone Costs and the Design of Rate Structures Bridger M. Mitchell,Rand

Corporation,1981 A well-developed body of economic theory is available to guide the setting of prices for the multi-product regulated firm. Economic efficiency can be increased by designing rate structures that incorporate the basic principles developed from this theory. These principles call for provisionally pricing each of the firm's outputs at its marginal cost, testing to determine whether such rates satisfy a specified budget constraint (e.g., revenues = costs), and then suitably modifying the marginal-cost rates in order to satisfy the constraint. Most commonly, the trial rates produce insufficient

revenue, and then rates must be raised according to the Ramsey rule--prices are increased above marginal costs in inverse proportion to the individual price elasticities of demand. This paper applies ratemaking theory to the design of rate structures for local telephone calls that efficiently rate the costs of the local network.
