Variation and Change in the Encoding of Motion Events Juliana Goschler, Anatol Stefanowitsch, 2013-11-14 The linguistic typology of motion event encoding is one of the central topics in Cognitive Linguistics. A vast body of typological, contrastive, and psycholinguistic research has shown the potential, but also the limitations of the original distinction between verb-framed and satellite-framed languages. This volume contains ten original papers focusing specifically on the variation and change of motion event encoding in individual languages and language families. The authors show that some of the central claims about motion event encoding need careful re-examination and reformulation and that individual languages and language families are more variable across space and time than even a refined typology could neatly capture at this time. The volume thus contributes to a more detailed and fine-grained foundation for the investigation of conceptual causes and consequences of different motion-event encoding strategies.

Encoding Motion Events Till Woerfel, 2018-09-10 Children who grow up as second- or third-generation immigrants typically acquire and speak the minority language at home and the majority language at school. Recurrently, these children have been the subject of controversial debates about their linguistic abilities in relation to their educational success. However, such debates fail to recognise that variation in bilinguals' language processing is a phenomenon in its own right that results from the dynamic influence of one language on another. This volume provides insight into cross-linguistic influence in Turkish-German and Turkish-French bilingual children and uncovers the nature of variation in L1 and L2 oral motion event descriptions by evaluating the impact of language-specific patterns and language dominance. The results indicate that next to typological differences between the speakers' L1 and L2, language dominance has an impact on the type and direction of influence. However, the author argues that most variation can be explained by L1/L2 usage preferences. Bilinguals make frequent use of patterns that exist in both languages, but are unequally preferred by monolingual speakers. This finding underlines the importance of usage-based approaches in SLA.

Encoding Events Xuhui Hu, 2018-09-04 This volume presents theoretical and empirical research on the syntax of events within the broader framework of generative grammar, focusing on the central question of how conceptual meaning interacts with narrow syntactic computation. Xuhui Hu proposes a set of integration conditions that require the content of the predicate to be licensed by theta-role information generated by narrow syntax. The other principal theoretical component of the book concerns the functional structure of events, which is related to issues such as the parallel between the event and nominal domains, the mapping of a predicate onto an entity, and the grammatical foundation of verb classification. The framework is applied to three areas: the syntax of resultatives in English and Chinese, cross-linguistic and diachronic variation in resultatives, and applicative constructions. The findings shed light on the thematic relationship between core arguments and predicates and on the syntax of non-core arguments, contribute to the theory of parametric variation in the generative tradition, and provide insights into the verb-framed vs satellite-framed typology

Encoding Motion Events in Mandarin Chinese Jingxia Lin, 2019-02-15 This book is a corpus-based description and discussion of how Modern Mandarin Chinese encodes motion events, with a focus on how the distribution of verbal motion morphemes is closely associated with the meanings they lexicalize. The book is not only the first work that proposes a finer-grained classification and diagnostics of Chinese motion morphemes from the perspective of scale structure, but also the first to more comprehensively account for the ordering of Chinese motion morphemes. The findings of this study will not only enrich the literature on motion events, but more importantly, further our understanding of the nature of motion events and the way motion events are conceived and represented in the Chinese language. The major proposals and the cognitive functional approach of this work will also shed light on studies beyond motion. The book will be a valuable resource for scholars interested in motion events, syntax-semantic interface, and typology.

Motion Encoding in Language and Space Mila Vulchanova, Emile van der Zee, 2013 This book brings together researchers in linguistics, computer science, psychology and cognitive science to investigate how motion is encoded in language. Part I considers the parameters of the field, while part II looks at the way in which spatial scale or granularity plays a role in the encoding of motion in language.

Visualization Analysis and Design Tamara Munzner, 2014-12-01 Learn How to Design Effective Visualization Systems Visualization Analysis and Design provides a systematic, comprehensive framework for thinking about visualization in terms of principles and design choices. The book features a unified approach encompassing information visualization techniques for abstract data, scientific visualization techniques for spatial data, and visual analytics techniques for interweaving data transformation and analysis with interactive visual exploration. It emphasizes the careful validation of effectiveness and the consideration of function before form. The book breaks down visualization design according to three questions: what data users need to see, why users need to carry out their tasks, and how the visual representations proposed can be constructed and manipulated. It walks readers through the use of space and color to visually encode data in a view, the trade-offs between changing a single view and using multiple linked views, and the ways to reduce the amount of data shown in each view. The book concludes with six case studies analyzed in detail with the full framework. The book is suitable for a broad set of readers, from beginners to more experienced visualization designers. It does not assume any previous experience in programming, mathematics, human-computer interaction, or graphic design and can be used in an introductory visualization course at the graduate or undergraduate level.

Space in Diachrony Silvia Luraghi, Tatiana Nikitina, Chiara Zanchi, 2017-08-14 Space is a fundamental dimension of human life and is pervasive in human experience. Research on space has highlighted the possible asymmetrical nature of spatial relations. Differences in the encoding of goals and sources of motion are a case in point, and cross-linguistic coding tendencies show that path is less frequently flagged by a dedicated case than goal, source/origin, and (static) location (locative). Interestingly, such asymmetries may correlate with certain types of landmark, as in the case of toponyms or of animate entities. Even though these issues have been focused upon both in typological and psycholinguistic research, they remain largely open. The papers in this collection aim to show that a diachronic approach may shed light on the way in which asymmetries in the space domain come about over time, thus contributing to the clarification of synchronically puzzling facts.

Computer-based Medical Guidelines and Protocols: A Primer and Current Trends A. Ten Teije, S. Miksch, P. Lucas, 2008-07-24 This book brings together results from different branches of computer science (in particular, artificial intelligence), medical informatics and medicine to examine cutting edge approaches to computer-based guideline modeling, verification and interpretation. Different methods have been developed to support the development, deployment, maintenance and use of evidence-based guidelines, using techniques from artificial intelligence, software engineering, medical informatics and formal methods. Such methods employ different representation formalisms and computational techniques. As the guideline-related research spans a wide range of research communities, a comprehensive integration of the results of these communities was lacking. It is the intention of this book to fill this gap. It is the first book of its kind that partially has the nature of a textbook. The book consists of two parts. The first part consists of nine chapters which together offer a comprehensive overview of the most important medical and computer-science aspects of clinical guidelines and protocols. The second part of the book consists of chapters that are extended versions of selected papers that were originally submitted to the ECAI-2006 workshop 'AI Techniques in Health Care: Evidence-based Guidelines and Protocols'. These chapters will provide the reader detailed information about actual research in the area by leading researchers.

Aggregating Dialectology, Typology, and Register Analysis Benedikt Szmrecsanyi, Bernhard Wälchli, 2014-01-31 This volume aims to overcome sub-disciplinary boundaries in the study of linguistic variation - be it language-internal or cross-linguistic. Even though dialectologists, register analysts, typologists, and quantitative linguists all deal with linguistic variation, there is astonishingly little interaction across these fields. But the fourteen contributions in this volume show that these subdisciplines actually share many interests and methodological concerns in common. The chapters specifically converge in the following ways: First, they all seek to explore linguistic variation, within or across languages. Second, they are based on usage data, that is, on corpora of (more or less) authentic text or speech of different languages or language varieties. Third, all chapters are concerned with the joint analysis (also sometimes known as "aggregation" or "data synthesis") of multiple phenomena, features, or measurements of some sort. And lastly, the contributors all marshal quantitative analysis techniques to analyse the data. In short, the volume explores the text-feature-aggregation pipeline in variation studies, demonstrating that there is much mutual inspiration to be had by thinking outside the disciplinary box.

Digital Logic and Microprocessor Design with VHDL Enoch O. Hwang, 2006 This book will teach students how to design digital logic circuits, specifically combinational and sequential circuits. Students will learn how to put these two types of circuits together to form dedicated and general-purpose microprocessors. This book is unique in that it combines the use of logic principles and the building of individual components to create data paths and control units, and finally the building of real dedicated custom microprocessors and general-purpose microprocessors. After understanding the material in the book, students will be able to design simple microprocessors and implement them in real hardware.
