*Performance and Reliability Analysis of Computer Systems* Robin A. Sahner, Kishor Trivedi, Antonio Puliafito, 2012-12-06 Performance and Reliability Analysis of Computer Systems: An Example-Based Approach Using the SHARPE Software Package provides a variety of probabilistic, discrete-state models used to assess the reliability and performance of computer and communication systems. The models included are combinatorial reliability models (reliability block diagrams, fault trees and reliability graphs), directed, acyclic task precedence graphs, Markov and semi-Markov models (including Markov reward models), product-form queueing networks and generalized stochastic Petri nets. A practical approach to system modeling is followed; all of the examples described are solved and analyzed using the SHARPE tool. In structuring the book, the authors have been careful to provide the reader with a methodological approach to analytical modeling techniques. These techniques are not seen as alternatives but rather as an integral part of a single process of assessment which, by hierarchically combining results from different kinds of models, makes it possible to use state-space methods for those parts of a system that require them and non-state-space methods for the more well-behaved parts of the system. The SHARPE (Symbolic Hierarchical Automated Reliability and Performance Evaluator) package is the 'toolchest' that allows the authors to specify stochastic models easily and solve them quickly, adopting model hierarchies and very efficient solution techniques. All the models described in the book are specified and solved using the SHARPE language; its syntax is described and the source code of almost all the examples discussed is provided. Audience: Suitable for use in advanced level courses covering reliability and performance of computer and communications systems and by researchers and practicing engineers whose work involves modeling of system performance and reliability.

Measuring, Modelling and Evaluating Computer Systems Heinz Beilner, Erol Gelenbe, 1977 Until rather recently, the unsatisfactory approach of first building computers and then measuring their performance was prevalent due to the lack of reliable methods and tools to predict all but the largest performance characteristics. Standardisation of simulation modelling and significant progress in the field of analytical modelling have improved drastically, but performance prediction and forecasting via system models are only as realistic as the description of system load presented to the models. This volume includes all papers accepted for presentation at the Third International Symposium sponsored by IRIA-LABORIA, IFIP Working Group 7.3, the Commission of the European Communities, Joint Research Centre, ISPRRA Establishment and organised by Gesellschaft für Mathematik und Datenverarbeitung, Bonn-Bad Godesberg, Western Germany, October 3-5, 1977.

**Notes on modelling of computer systems and networks** Stanford University Stanford Electronics Laboratories. Digital Systems Laboratory, P. S. Yu, 1978 Formulation of given computer system or network problems into abstract stochastic models is considered. Generally speaking, model

formulation is an art. While analytic results are clearly not powerful enough to provide a cookbook approach to modelling, general methodology and difficulties on model formulation are discussed through examination of various computer system and network models. These models are presented in a systematic way based on the hierarchical approach.

Performance Evaluation of Computer and Communication Systems Jean-Yves Le

Boudec,2011-02-01 This book is written for computer engineers and scientists active in the development of software and hardware systems. It supplies the understanding and tools needed to effectively evaluate the performance of individual computer and communication systems. It covers the theoretical foundations of the field as well as specific software packages being employed by leaders in the field.

*Heavy Flavour Physics* I. I. Bigi, Luigi Moroni, Società italiana di fisica, 1998 The lectures collected in this book present a comprehensive review of the current knowledge of heavy-quark physics, from the points of view of both theory and experiment. Heavy Flavour Physics has accomplished enormous progress during the last few years: the last heavy quark has been discovered and the quality of the collected data on the other relatively lighter quarks has dramatically improved. On the theory side, noticeable progress has been reported on new calculations of decay rates based on various techniques, such as QCD sum rules, heavy-quark mass expansion and lattice QCD. The theory of heavy quark production is constantly improving and awaiting new results. Nevertheless there are strong reasons to believe that the Standard Model of High Energy Physics is incomplete. It exhibits very peculiar patterns for which it offers no explanation. The basic constituents of matter are arranged into three seemingly identical generations or families of quarks and leptons, differing merely in their masses. The pattern in the fermion masses, why they are families and why there are three of them is not yet understood. Furthermore it is known that at least within the standard model there is an intimate connection between the replication of families and the gateway of CP violation, in addition, the latter phenomenon is a crucial ingredient in explaining why our universe is made up almost exclusively of matter rather than being more or less matter-antimatter symmetric. How and to what extent can Heavy Flavour Physics impact on these questions? Does it offer novel windows onto New Physics beyond the Standard Model in general and onto new symmetries, such as Supersymmetry in particular? These questions constitute the central theme of this book. The material treated in this publication may serve as reference for the segment of the high-energy community actively engaged in heavy-quark physics.

Introduction to Computer System Performance Evaluation Krishna Kant, M. M. Srinivasan, 1992

In this book, Krishna Kant provides a completely up-to-date treatment of the fundamental techniques of computer system performance modeling and evaluation. He discusses measurement, simulation, and analysis, and places a strong emphasis on analysis by including such topics as basic and advanced queuing theory, product form networks, aggregation, decomposition, performance bounds, and various forms of approximations. Applications involving synchronization between various activities are presented in a chapter on Petri net-based performance modeling, and a final chapter covers a wide range of problems involving steady state analysis, transient analysis, and optimization.
