Recommended Design Specifications for Live Load Distribution to Buried Structures D. Lee Petersen, 2010 This report provides recommendations to revise the AASHTO LRFD Bridge Design Specifications relating to the distribution of live load to buried structures. The report details the development of simplified design equations (SDEs) for structural response based on three-dimensional (3D) analysis of 830 buried culverts. In addition, the report provides guidelines for conducting 2D and 3D modeling for design situations with conditions not covered by the SDEs. The material in this report will be of immediate interest to roadway and bridge designers.

Guide to the Use of the Wind Load Provisions of ASCE 7-95

Kishor C. Mehta, Richard D. Marshall, 1998-01-01 The objective of the Guide to the Use of the Wind Load Provisions of ASCE 7-95 is to provide guidance in the use of the wind load provisions set forth in ASCE Standard 7-95. The Guide is a completely new document because the wind load provisions underwent major changes from the previous ASCE Standard 7-88 (or ASCE 7-93). The Guide contains six example problems, worked out in detail, which can provide direction to practicing professionals in assessing wind loads on a variety of buildings and other structures. Errata and Clarifications from the previous guide is also included.

Wind Loading of Structures John D. Holmes,2007-04-17

Bridging the gap between wind and structural engineering, *Wind Loading of Structures* demonstrates the application of wind engineering principles to ensure maximum safety in a variety of structures. This book will assist the practising engineer in understanding the principles of wind engineering, and provide guidance on the successful design of structures for wind loading by gales, hurricanes, typhoons, thunderstorm downdrafts and tornados. The principles of meteorology, statistics and probability, aerodynamics and structural dynamics are covered in the first half of the book. The second half describes, qualitatively and quantitatively, the nature of wind loads on all types of structures, including low-rise and tall buildings, large stadium roofs, towers and chimneys, bridges, transmission lines, free-standing walls and roofs, and antennae. Special features include coverage of extreme winds in tropical and sub-tropical climates, wind-tunnel testing techniques, a summary of the wind climates of over sixty countries, and detailed coverage of internal as well as external wind

pressures on buildings. A comparison is made of the provisions for wind loads in six major national and international codes and standards. Examples and case studies are given in each chapter that make the book suitable for supporting university graduate courses in wind loading and response.

Compiler Construction David A. Watt, 2003-06-29 ETAPS2000 was the third instance of the European Joint Conference on Theory and Practice of Software. ETAPS is an annual federated conference that was established in 1998 by combining a number of existing and new conferences. This year it comprised 7 conferences (FOSSACS, FASE, ESOP, CC, TACAS), 7 satellite workshops (CBS, CMCS, CoFI, GRATRA, INT), seven invited lectures, a panel discussion, and ten tutorials. The events that comprise ETAPS address various aspects of the system development process, including specification, design, implementation, analysis, and improvement. The languages, methodologies, and tools which support these activities are all well within its scope. Different blends of theory and practice are represented, with an inclination towards theory with a practical motivation on one hand and soundly-based practice on the other. Many of the issues involved in software design apply to systems in general, including

hardware systems, and the emphasis on software is not intended to be exclusive.

**Effect of Load Voltage on Thin-film Cuprous Sulfide – Cadmium
Sulfide Solar Cells Thermally Cycled in a Simulated Space
Environment** John J. Smithrick, Ralph D. Thomas, 1971 Thin-film
Cu₂S-CdS solar cells, loaded at various fixed values of load

resistance, were thermally cycled for 1429 cycles in a simulated space environment. Cell performance was measured under controlled conditions in air before and after thermal cycling. These data were used to determine the effect of load voltage on cell performance. The performance of the cells was relatively independent of load voltage up to about 0.39 volt. This appears to be a threshold voltage, beyond which there was a significant loss in cell performance. Fortunately, this threshold voltage appears to be sufficiently higher than the maximum power voltage of 0.33 volt so that it can be avoided in most applications.

A Computer Program for Determining the Load-carrying Capability of the Running Skyline Ward W. Carson, Donald D. Studier, 1973 The running skyline is a popular cable logging system being used in many parts of North America today. Proper application of this system requires investigation of its adaptability to the terrain being logged. This paper presents a digital computer program to determine running skyline load-carrying capabilities to aid the logging layout designer with this planning task. The Fortran IV program, the details of input, and the interpretation of output are discussed.
