Developing a Command and Control Application: Lessons Learned from FLEX. ,1999 This paper documents the lessons learned from the development of a command and control (C2) application, the Force Level EXecution (FLEX) software system. FLEX is the battle management software for monitoring the execution of Joint Air Operations in the Air Force Electronic Systems Center's Theater Battle Management Core Systems (TBMCS). FLEX, like other large software applications, experienced many well-known problems in software engineering such as requirements creep and early lack of domain expertise. FLEX also experienced integration pains as it relied on an evolving TBMCS data and service infrastructure for basic operations. This infrastructure supported migration from a traditional stove-piped system to a layered architecture. We will discuss these common problems, as well as FLEX-specific problems, and make recommendations to help ongoing and future software developments mitigate some of the same risks. While targeted mainly for the DoD C2 development community, the lessons learned herein should also apply to the large-scale software development in industry. This paper starts with a discussion of the early years of FLEX, moves into the DoD mandated the use of Ada, and works its way to the current modern, lightweight, distributed, web-based and segmented FLEX Architecture.

Apollo for Adobe Flex Developers Pocket Guide Mike Chambers,Rob Dixon,Jeff Swartz,2007-03-09 Written by members of the Apollo product team, this is the official guide to the Alpha release of Adobe Apollo, the new cross platform desktop runtime from Adobe Labs. Apollo for Adobe Flex Developers Pocket Guide explains how to build and deploy Flash-based Rich Internet Applications (RIAs) to the desktop using Adobe's Flex framework. This book describes concisely how Apollo works, and offers numerous examples for those who want to start building RIAs for the desktop right away. Why put RIAs on the desktop? They're already supposed to offer the responsiveness of desktop programs. Unfortunately, web browsers were designed to deliver and display HTML-based documents, not applications. The conflict between document- and application-focused functionality creates several problems when deploying applications via the browser. Adobe Apollo gives you the best of both worlds -- the web development model and true desktop functionality. This pocket guide explains how to: Set up your development environment Create your first application Use the File I/O API Use HTML within Flex-based Apollo applications Use the included Apollo mini-cookbook for common tasks The book also includes a guide to Apollo packages, classes, and command-line tools. Once you understand the basics of building a Flex-based Apollo application, this pocket guide makes an ideal reference for tackling specific problems.
