*Highly Contiguous Plant Genome Assembly and Transcriptional Regulation* Kai-Hua Jia,Yongpeng Ma,Wei Zhao,Guanjing Hu,2024-03-01 Highly contiguous reference genome sequences are a prerequisite for genomics research and for the optimal utilization of plant species. However, whole-genome duplication events and subsequent chromosomal rearrangements and losses shape the complex features and extensive diversity of plant genomes, and hinder their highly contiguous assembly. With the advent of single-molecule, long-read sequencing technologies, such as PacBio High-Fidelity (HiFi) and Oxford Nanopore Technologies (ONT), as well as Bionano genomics and high-throughput chromatin conformation capture (Hi-C), many highly complex chromosome-level genomes have been revealed, even with phased haplotypes. These advanced sequencing technologies, coupled with improvements in assembly methods, have greatly improved the quality of the assembled genomes. Transcriptomics and metabolomics are playing an increasingly important role in research into genetic variation and functional genes, and enable their combination with other omics studies. For example, in studies of plant stress resistance, the application of transcriptomics and metabolomics technologies allows comprehensive and dynamic detection of the spatial and temporal changes in plant genes/metabolite expression under stress, enabling functional genes to be “mined” and the regulatory mechanism underlying stress responses to be analyzed, providing a molecular genetic basis for the breeding of stress-resistant varieties.

*Domain Decomposition Methods for the Numerical Solution of Partial Differential Equations* Tarek Mathew,2008-06-25 Domain decomposition methods are divide and conquer computational methods for the parallel solution of partial differential equations of elliptic or parabolic type. The methodology includes iterative algorithms, and techniques for non-matching grid discretizations and heterogeneous approximations. This book serves as a matrix oriented introduction to domain decomposition methodology. A wide range of topics are discussed include hybrid formulations, Schwarz, and many more.

Higher Structures in Geometry and Physics Alberto S. Cattaneo,Anthony Giaquinto,Ping Xu,2010-11-25 This book is centered around higher algebraic structures stemming from the work of Murray Gerstenhaber and Jim Stasheff that are now ubiquitous in various areas of mathematics— such as algebra, algebraic topology, differential geometry, algebraic geometry, mathematical physics— and in theoretical physics such as quantum field theory and string theory. These higher algebraic structures provide a common language essential in the study of deformation quantization, theory of algebroids and groupoids, symplectic field theory, and much more. Each contribution in this volume expands on the ideas of Gerstenhaber and Stasheff. The volume is intended for post-graduate students, mathematical and theoretical physicists, and mathematicians interested in higher structures.

*Elliptic Carleman Estimates and Applications to Stabilization and Controllability, Volume II* Jérôme Le Rousseau,Gilles Lebeau,Luc Robbiano,2022-04-22 This monograph explores applications of Carleman estimates in the study of stabilization and controllability properties of partial differential equations, including quantified unique continuation, logarithmic stabilization of the wave equation, and null-controllability of the heat equation. Where the first volume derived these estimates in regular open sets in Euclidean space and Dirichlet boundary conditions, here they are extended to Riemannian manifolds and more general boundary conditions. The book begins with the study of Lopatinskii-Sapiro boundary conditions for the Laplace-Beltrami operator, followed by derivation of Carleman estimates for this operator on Riemannian manifolds. Applications of Carleman estimates are explored next: quantified unique continuation issues, a proof of the logarithmic stabilization of the boundary-damped wave equation, and a spectral inequality with general boundary conditions to derive the null-controllability result for the heat equation. Two additional chapters consider some more advanced results on Carleman estimates. The final part of the book is devoted to exposition of some necessary background material: elements of differential and Riemannian geometry, and Sobolev spaces and Laplace problems on Riemannian manifolds.
