Healthcare and Medical Apps Paul Love,2018-10-21 There's a quiet revolution (or maybe evolution is more accurate) going on in the healthcare industry.Over the last ten years over 250,000 mobile healthcare apps have appeared on the scene - and that's only the beginning. According to estimates from Zion Market Research the market for mHealth (mobile health) apps will top \$100 billion worldwide in 2018. With smartphones and tablets becoming an essential part of our lives it makes sense to provide apps for those devices that can help organize your medical records, monitor your health, alert you to a possible medical problem, and help connect you to a healthcare professional.So how do smartphones function as medical devices? The cameras, microphones, and other sensors built into smartphones are improving all the time and can already be used to help diagnose certain illnesses The microphone for example, can be used to help detect asthma and COPD (Chronic Obstructive Pulmonary Disorder). There are also apps that use the camera and flash to diagnose blood disorders such as iron and hemoglobin deficiency. Smartphones can even be used to detect conditions such as osteoporosis by using the phone's motion sensor.Doctors and medical researchers are also turning to smartphone technology as an efficient way to handle electronic health data. Having patients collect data relating to their

medical condition by using a smartphone app can make it much easier for a physician to form a diagnosis and to follow up on the effectiveness of the treatment the patient is undergoing. And that same data collected from many different patients can be a gold mine for medical research personnel, providing them with a massive database of clinical information never available before. This book covers just a few of the many different types of mobile health apps available on the market today. Dozens more (including many that offer new and more advanced technology) are being added everyday. Consider this book a sampler - and, if you're interested in building a mobile health care app yourself, you'll also find some introductory information about building your own app. Welcome to the future of healthcare!

Health Care Apps Manufacturing Subcommittee on Commerce,2017-05-28 The ubiquity of smartphones and advanced broadband Internet technology have enabled the deployment of health apps. The draw of mobile healthcare tools, services and health apps particularly lies in their potential to radically improve health care. The potential comes in part from enabling both sides of the equation: doctors and patients. For healthcare providers, health apps enable constant, instant, and real-time access to patient data, helping to make streamlining of work flows and decisionmaking processes, so the data is both more complete and more accessible. Doctors are also able to remotely monitor patient healthcare conditions, collaborate, and implement care. Patients are using apps to track symptoms, send vital sign information to doctors, and set up medication adherence reminders. Patients are also using the technology to gain faster access to more routine healthcare services that are often inconvenient or time-consuming. Apps available on the market today create virtual waiting rooms where users can receive their prescriptions, engage in face-to-face video consultations with physicians, compare prices for health care, and make payments to a healthcare provider. By enabling physicians to remotely monitor a patient's health condition or by empowering consumers with information to engage in healthier living, health apps are driving more robust healthcare management and oversight from both patients and doctors.

Design and Evaluation of iCare App - A Persuasive MHealth App to Help Working-Class Indian Women to Manage Stress and Anxiety Jaisheen Kour Reen,2022 Persuasive Technologies are used for improving mental health and well-being. They contribute to the communal drive toward equality by making mental health care more accessible. PTs can be delivered in the form of mobile apps. However, most existing apps focus on designing for people in developed countries. To address this gap, this thesis presents the design, development, and evaluation of iCare, a mobile health app for promoting mental health and well-being among an underserved population - working-class Indian women. We combined the power of mobile health and PTs. We used a User-Centered Design approach to ensure that the needs of our target population are included in the design of the iCare app. We divided our study into three phases, and in each phase, our target audience played an active role. This ensures that the iCare app is tailored to our target audience, truly helping them manage their stress and anxiety.
