Guidelines on Core Components of Infection Prevention and Control Programmes at the National and Acute Health Care Facility Level World Health Organization, 2017-01-31 Health care-associated infections (HAI) are one of the most common adverse events in care delivery and a major public health problem with an impact on morbidity, mortality and quality of life. At any one time, up to 7% of patients in developed and 10% in developing countries will acquire at least one HAI. These infections also present a significant economic burden at the societal level. However, a large percentage are preventable through effective infection prevention and control (IPC) measures. These new guidelines on the core components of IPC programmes at the national and facility level will enhance the capacity of Member States to develop and implement effective technical and behaviour modifying interventions. They form a key part of WHO strategies to prevent current and future threats from infectious diseases such as Ebola, strengthen health service resilience, help combat antimicrobial resistance (AMR) and improve the overall quality of health care delivery. They are also intended to support countries in the development of their own national protocols for IPC and AMR action plans and to support health care facilities as they develop or strengthen their own approaches to IPC. These are the first international evidence-based guidelines on the core components of IPC programmes. These new WHO guidelines are applicable for any country and suitable to local adaptations, and take account of the strength of available scientific evidence, the cost and resource implications, and patient values and preferences.

Readers will also find: A thorough introduction to the chain of infection and the main groups of micro-organisms causing infection Comprehensive explorations of the application of evidence-based practice principles to infection prevention and control Practical discussions of immunity, microbiology laboratories,

antimicrobial drugs, and policies and protocols for infection prevention and control The role of epidemiology and public health in the prevention and control of infectious disease Perfect for student nurses and students of allied health professions, Infection Prevention and Control in Healthcare Settings will also benefit practitioners and managers in the health services seeking to update their knowledge of infection control and prevention in healthcare settings.

Hospital Infection Prevention Chand Wattal,Nancy Khardori,2013-10-30 The art of medicine becomes science when supported by evidence. The recommended practices of infection prevention are based on scientific and epidemiologic evidence. However, most health care professionals see them as mandates and fail to incorporate them into their routine patient care activities. The core goal of this publication is to link the practices to the principles they are based on. The expectation is that understanding of the principles will change the practices from mandates to should do in the minds of health care professionals. This will lead to improvement in health care by preventing unintended harm to patients, co-workers and the communities at large. At the same time, the text provides a comprehensive, thorough and up to date information on all aspects of infection prevention in a reader-friendly manner and therefore, will serve as a valuable reference.

Manual of Infection Prevention and Control Nizam Damani,2019 It has been estimated that in developed countries up to 10% of hospitalized patients develop infections every year. Not only is there a substantial cost to healthcare systems, but some healthcare associated infections (HCIs) can be fatal. Since the majority of HCIs are preventable, reducing HCIs is now considered to be an integral part of patient safety and quality of care provided by all healthcare institutions worldwide. Unlike other books on infection control, the main strength of this book is to provide clear, up-to-date and practical guidance in infection control in an easy to read format which can act as a quick source of reference on all aspects of HCI for healthcare workers who are either directly or indirectly involved in prevention and control of HCIs. Although the book's main audience is infection control practitioners such as doctors, nurses, public health physicians, it is also a valuable reference for environmental health officers, health educators, practice managers in GP surgeries, and health service managers--
