Intelligent Biometric Techniques in Fingerprint and Face Recognition Lakhmi C. Jain,Ugur Halici,Isao Hayashi,S.B. Lee,Shigeyoshi Tsutsui,1999-06-29 The tremendous world-wide interest in intelligent biometric techniques in fingerprint and face recognition is fueled by the myriad of potential applications, including banking and security systems, and limited only by the imaginations of scientists and engineers. This growing interest poses new challenges to the fields of expert systems, neural networks, fuzzy systems, and evolutionary computing, which offer the advantages of learning abilities and human-like behavior. *Biometric Techniques in Fingerprint and Face Recognition* presents a thorough treatment of established and emerging applications and techniques relevant to this field so rich with opportunity.

Intelligent System For Face Recognition Using Soft Computing R. Vinodini,2022-12-22 In Our daily life Vision plays a very important role to understand the universe in every aspect. The vision system of our body takes care of taking the information about objects to the brain and recognizes them through the training by the neural system. For this operation the complex design of the body does with very little effort. This creates a advanced feedback and response method between the world and humans. The human vision system has led inventors and engineers to build devices which can visualize like people, analyze and do decision making. The so called Artificial intelligence do more than a normal human do. This helped people to build

devices and machines which can make life easier and do difficult tasks easily. The security systems in banking etc were moved from password based security to image processing method. The human machine interface needs the human face recognition system for operation. For security and image processing applications the face detection is the major block which does the main role. In biometric systems the research is focused mainly on the detection of face from a camera image and should be recognized, In crime investigations the process is difficult since the face to be detected and recognized is from a camera which records a video from which the face has to be detected using frame analyzes. The process becomes complex if the image is captured in a bad light or worst climatic conditions. So the design of methods becomes more interesting that verifies the presence of faces from dim or worst images. To overcome the problems this research is focused on new methodologies which can detect and recognize faces. Consider a system which does the pattern-recognition based on the face detection which detects the face and recognizes the face based on the feature vectors of the behavioral or physiological characteristics. The most secure way of accessing banking process is authenticated using biometrics. Since the individual verification is done using a physical and unique biometric characteristic, the conventional passwords or PINs based accessibility frauds can be reduced on corporate computer networks and the Internet because they can be guessed or stolen. Plastic cards, smart cards or computer token cards by themselves are

also not secure because they can be forged, stolen or lost, or can become corrupt or unreadable. Biometric methods for identification can be widely adapted to forensics, ATM banking, time and attendance recording, access control and many other applications. The face recognition provides multiple benefits passively over the other methods. But the past methods voluntary action has the disadvantages of being tough to use as well as non adaptable for covert use as in surveillance applications. Human operators are prone to errors during Face image audit and verification during logging biometrics records. Good face images are easier to acquire than good fingerprints. About 5% of people cannot provide a fingerprint for verification. The reasons may be due to dry skin, diseased skin, old skin, cut skin, callused finger, oriental skin, bandaged finger, narrow finger, smudged sensor on reader.

Handbook of Remote Biometrics Massimo Tistarelli, Stan Z. Li, Rama Chellappa, 2009-06-02 The development of technologies for the identification of individuals has driven the interest and curiosity of many people. Spearheaded and inspired by the Bertillon coding system for the classification of humans based on physical measurements, scientists and engineers have been trying to invent new devices and classification systems to capture the human identity from its body measurements. One of the main limitations of the precursors of today's biometrics, which is still present in the vast majority of the existing biometric systems, has been the need to keep the device in close contact with the subject to capture the biometric measurements. This clearly

limits the applicability and convenience of biometric systems. This book presents an important step in addressing this limitation by describing a number of methodologies to capture meaningful biometric information from a distance. Most materials covered in this book have been presented at the International Summer School on Biometrics which is held every year in Alghero, Italy and which has become a flagship activity of the IAPR Technical Committee on Biometrics (IAPR TC4). The last four chapters of the book are derived from some of the best presentations by the participating students of the school. The educational value of this book is also highlighted by the number of proposed exercises and questions which will help the reader to better understand the proposed topics.

The rule of law on the Internet Council of Europe, 2014-12-09 We exercise a significant part of our human rights today using the Internet and the wider digital environment. But our human rights can also be breached using these very same means. There is general agreement that human rights should be enjoyed online as they are offline. In practice, however, the actors who can ensure that we enjoy human rights are not exactly the same in the two environments. In particular, the disproportionate influence and control that

certain states and certain private companies exercise on the Internet and its physical infrastructure at the global level, are two essential elements of this difference. This issue paper looks at how the rule of law can be maintained in an environment characterised by these specific governance issues, focusing on some policy areas of particular human rights relevance: freedom of expression, data protection and privacy, cybercrime and national security. It suggests possible ways forward to ensure that we can trust the rule of law to apply to our online activities.

Gifts of the Crow John Marzluff, Tony Angell, 2013-02-05 A University of Washington professor of wildlife science taps the findings of his extraordinary research into crow intelligence to offer insight into their ability to make tools and respond to environmental challenges, explaining how they engage in human-like behaviors from giving gifts and seeking revenge to playing and experiencing dreams.

From the outside, I have a perfect life. A billionaire with a beautiful family. But if you could see inside my head, you'd know I'm as f-

ed up as a person can be. Now more than ever. I'm driven, relentless, and successful, but all of that means nothing without my wife and daughters. They're my entire world, and I failed them. Now I can barely look at them without drowning in an abyss of self-recrimination. Digital technology is both friend and foe: highly disruptive, yet it cannot be ignored. As traditional products transform into smart connected products faster than ever before, companies that fail to make use of it now put themselves in the firing line for disintermediation or even eradication.
