The Solar System an Astronomical Unit George Adam, 2009-08 Purchase of this book includes free trial access to www.million-books.com where you can read more than a million books for free. This is an OCR edition with typos. Excerpt from book: CHAPTER VII. The Present Evolutionary Period of Mars. The important features of this planet are its relative distance from the Sun (141,500,000 miles), about one and one-half times the distance of the Earth from the solar body; its seasonal polar caps; and its canals, also seasonal, stretching from the summer pole beyond the equator, and well towards the winter pole. The volume of Mars is one-seventh that of the Earth, and its density is calculated as seven-tenths that of the Earth. In as much as the planet is further from the Sun than the Earth so it is behind in evolutionary period. Mars is probably at that period corresponding to the archaean age of the Earth when the primary or Laurentian system of rocks was formed. A difference of opinion exists among observers as to there being water on Mars. Spectra of planets must vary according to their positions relative to the Sun and the Earth. Mars in conjunction and in opposition will reflect solar light from the hemisphere proximate to the Sun, where his atmosphere will contain little or no water. In quadrature, especially if the planet's winter pole can be viewed, is the most favorable position to get the spectrum of water. Mars has but one water cycle: From surface water to the cloud, H₂O, thence to the winter pole where it manifests as a snow or ice cap, 11262, thence from the same, now summer pole, through the canals toward the then winter pole. Thus Mars is tearing up his polar unstratified rocks and forming Laurentian stratifications. The snow caps at the poles of Mars enlarge during their respective winters and become smaller or entirely disappear during their summers. It seems that in the water cycle of Mars the water-vapor in the atmosphere and the water-liquid in canals seek the pole of the planet furthest f...

The Solar System Thomas Dick, 2009-08 Purchase of this book includes free trial access to www.million-books.com where you can read more than a million books for free. This is an OCR edition with typos. Excerpt from book: means of equatorial telescopes, which can be made to point to any particular part of the heavens, all the larger stars of the firmament may be seen even at noonday, while the sun is shining in all his splendor; nay, there is scarcely a star visible to the naked eye, during night, but may be seen in this way during the blaze of day, and its exact position in the heavens pointed out. During a total eclipse of the sun, when the moon interposes her dark body between us and the sun, some of the planets and the larger stars have appeared distinctly as at midnight; but the moment the moon has passed a little over the disk of the sun, and a glimpse of his beams has shone out, their feeble light becomes undistinguishable, and they are no longer perceived. Sometimes, too, it happens that stars have been seen from the bottom of deep wells and mines, when large ones happen to pass near the zenith during the day, and the planet Venus, when brightest, has frequently been seen with the naked eye in the daytime, when at no great distance from the sun. Thus it appears that the sun passes through the heavens every day with stars all around him, although invisible to the unassisted eye? just as the moon, during night, is seen surrounded with stars, which the faintness of her light is not sufficient to overpower. Hence it happens that astronomers can trace the exact path of the sun among the stars, every day, during his apparent annual circuit round the heavens. They can tell what stars are near and around the sun; what clusters he is leaving behind him, to what other clusters he is approaching; what stars or planets are near his margin, and what stars are behind his luminous globe, with as much accuracy as if they were all visible to the naked eye, as ...

Solar System Dynamics Carl D. Murray,Stanley F. Dermott,2000-02-13 The Solar System is a complex and fascinating dynamical system. This is the first textbook to describe comprehensively the dynamical features of the Solar System and to provide students with all the mathematical tools and physical models they need to understand how it works. It is a benchmark publication in the field of planetary dynamics and destined to become a classic. Clearly written and well illustrated, *Solar System Dynamics* shows how a basic knowledge of the two- and three-body problems and perturbation theory can be combined to understand features as diverse as the tidal heating of Jupiter's moon Io, the origin of the Kirkwood gaps in the asteroid belt, and the radial structure of Saturn's rings. Problems at the end of each chapter and a free Internet Mathematica® software package are provided. *Solar System Dynamics* provides an authoritative textbook for courses on planetary dynamics and celestial mechanics. It also equips students with the mathematical tools to tackle broader courses on dynamics, dynamical systems, applications of chaos theory and non-linear dynamics.
