Uremic Toxins and Organ Failure Hideyuki Saito,Takaaki Abe,2020-10-12 This book describes the latest research on the gut-kidney axis of ureic solutes; the toxico-pathological mechanisms of uremic toxin-induced organ failure, including kidney and cardiovascular tissue; and the preventive therapeutic strategies for uremia and related organ failure associated with kidney injuries and diseases. Retained uremic toxins cause a variety of symptoms, such as hypertension, fatigue, renal anemia, osteoporosis and neurologic impairment, which are apparent in chronic kidney disease (CKD) patients. The human gastrointestinal tract contains trillions of microorganisms, referred to as gut microbiota, which support the host metabolism by producing nutrients, such as vitamins and short-chain fatty acids. However, they also produce various harmful uremic toxins that show renal and cardiovascular toxicity, and correlate with an increased mortality in CKD patients. The composition and balance of gut microbiota are associated with the accumulation of uremic toxins and the pathophysiology of CKD, and as such are being considered for a novel therapeutic strategy.

Organelle and Molecular Targeting Lara Scheherazade Milane,Mansoor M. Amiji,2021-12-29 We have surpassed the omics era and are truly in the Age of Molecular Therapeutics. The fast-paced development of SARS-CoV-2 vaccines, such as the mRNA vaccines encoding the viral spike protein, demonstrated the need for and capability of molecular therapy and nanotechnology-based solutions for drug delivery. In record speed, the SARS-CoV-2 viral RNA genome was sequenced and shared with the scientific community, allowing the rapid design of molecular therapeutics. The mRNA vaccines exploit the host cell endoplasmic reticulum to produce viral spike proteins for antigen presentation and recognition by the innate and adaptive immune system. Lipid nanoparticles enable the delivery of the fragile, degradation-sensitive nucleic acid payloads. Molecular-based therapeutics and nanotechnology solutions continue to drive the scientific and medical response to the COVID-19 pandemic as new mRNA, DNA, and protein-based vaccines are developed and approved and the emergency use approved vaccines are rapidly manufactured and distributed throughout the globe. The need for molecular therapies and drug delivery solutions is clear, and as these therapies progress and become more specialized there will be important advancements in organelle targeting. For example, using organelle targeting to direct lipid nanoparticles with mRNA payloads to the endoplasmic reticulum would increase the efficacy of mRNA vaccines, reducing the required dose and therefore the biomanufacturing demand. Likewise, improving the delivery of DNA therapeutics to the nucleus would improve efficacy. Organelles and molecules have always been drug targets, but until recently we have not had the tools or capability to design and develop such highly specific therapeutics. Organelle targeting has far-reaching implications. For example, mitochondria are central to both energy production and intrinsic apoptosis. Effectively targeting and manipulating mitochondria has therapeutic applications for diseases such as myopathies, cancer, neurodegeneration, progerias, diabetes, and the natural aging process. The SARS-CoV-2 vaccines that exploit the endoplasmic reticulum (for mRNA vaccines) and the nucleic translational process (DNA vaccines) attest to the need for organelle and molecular therapeutics. This book covers the status, demand, and future of organelle- and molecularly targeted therapeutics that

are critical to the advancement of modern medicine. Organelle and molecular targeting is the drug design and drug delivery approach of today and the future; understanding this approach is essential for students, scientists, and clinicians contributing to modern medicine.
