A Digital Phase Locked Loop based Signal and Symbol Recovery System for Wireless Channel Basab Bijoy Purkayastha,Kandarpa Kumar Sarma,2015-01-29 The book reports two approaches of implementation of the essential components of a Digital Phase Locked Loop based system for dealing with wireless channels showing Nakagami-m fading. It is mostly observed in mobile communication. In the first approach, the structure of a Digital phase locked loop (DPLL) based on Zero Crossing (ZC) algorithm is proposed. In a modified form, the structure of a DPLL based systems for dealing with Nakagami-m fading based on Least Square Polynomial Fitting Filter is proposed, which operates at moderate sampling frequencies. A sixth order Least Square Polynomial Fitting (LSPF) block and Roots Approximator (RA) for better phase-frequency detection has been implemented as a replacement of Phase Frequency Detector (PFD) and Loop Filter (LF) of a traditional DPLL, which has helped to attain optimum performance of DPLL. The results of simulation of the proposed DPLL with Nakagami-m fading and QPSK modulation is discussed in detail which shows that the proposed method provides better performance than existing systems of similar type.

Damage and Recovery in Electron Irradiated Silicon Heavily Doped with Phosphorus C. P. Carnes,1970 The damaging effects of radiation on solid state devices are ultimately traceable to radiation-induced changes in material properties vital to the performance characteristics of the device. The identification of defect structures, and an understanding of how they are introduced, altered and removed, and an understanding of the changes in physical properties caused by these defects are important in assessing the effects produced in devices and in evolving corrective measures. The work reported here deals with the introduction and recovery of damage produced in 0.1 ohm-cm P-doped float-zone silicon irradiated at room temperature with 1.0-MeV electrons. Possible explanations are considered for the reduction of the damage introduction rate with repeated electron irradiations and the annealing behavior is compared to that observed in more lightly doped material. The authors suggest that the decrease in introduction rate may be due to recombinations of mobile vacancies with trapped interstitials and/or to recombinations of mobile interstitials with vacancies at defect structures. Isothermal annealing experiments were performed to determine the kinetics of the recovery processes. The recovery kinetics were not resolved, but the recovery processes in silicon heavily doped with phosphorus appear to be more complicated with those involved in more lightly doped material.
