Methods of Behavior Analysis in Neuroscience Jerry J. Buccafusco,2000-08-29 Using the most well-studied behavioral analyses of animal subjects to promote a better understanding of the effects of disease and the effects of new therapeutic treatments on human cognition, *Methods of Behavior Analysis in Neuroscience* provides a reference manual for molecular and cellular research scientists in both academia and the pharmaceutical

Memory Larry R. Squire, Eric R. Kandel,2003 What is memory and where in the brain is it stored? How is memory storage accomplished? Two scientists responsible for some of the fundamental research in the field answer these key questions in *Memory: From Mind to Molecules*, the first book for a general readership to offer an up-to-date, comprehensive overview of memory from molecules and cells to brain systems and cognition.

The Oxford Handbook of Metamemory John Dunlosky, Sarah Tauber,2016-04-12 The *Oxford Handbook of Metamemory* investigates the human ability to evaluate and control learning and information retrieval processes. Each chapter in this authoritative guide highlights a different facet of metamemory research, including classical metamemory judgments; applications of metamemory research to the classroom and courtroom; and cutting-edge perspectives on continuing debates and theory. Chapters also provide broad historical overviews of each research area and discussions of promising directions for future research. The breadth and depth of coverage on offer in this Handbook make it ideal for seminars on metamemory or metacognition. It would also be a valuable supplement for advanced courses on cognitive psychology, of use especially to graduate students and more seasoned researchers who are interested in exploring metamemory for the first time.

Evolution of Learning and Memory Mechanisms Mark A. Krause, Karen L. Hollis, Mauricio R. Papini,2022-05-19 *Evolution of Learning and Memory Mechanisms* is an exploration of laboratory and field research on the many ways that evolution has influenced learning and memory processes, such as associative learning, social learning, and spatial, working, and episodic memory systems. This volume features research by both outstanding early-career scientists as well as familiar luminaries in the field. Learning and memory in a broad range of animals are explored, including numerous species of invertebrates (insects, worms, sea hares), as well as fish, amphibians, birds, rodents, bears, and human and nonhuman primates. Contributors discuss how the behavioral, cognitive, and neural mechanisms underlying learning and memory have been influenced by evolutionary pressures. They also draw connections between learning and memory and the specific selective factors that shaped their evolution. *Evolution of Learning and Memory Mechanisms* should be a valuable resource for those working in the areas of experimental and comparative psychology, comparative cognition, brain-behavior evolution, and animal behavior.

The Missing Link in Cognition Herbert S. Terrace, Janet Metcalfe,2005-01-20 Are humans unique in having self-reflective consciousness? Or can precursors to this central form of human consciousness be found in non-human species? *The Missing Link in Cognition* brings together a diverse group of researchers who have been investigating this question from a variety of perspectives, including the extent to which non-human primates, and, indeed, young children, have consciousness, a sense of self, thought process, metacognitions, and representations. Some of the participants--Kitcher, Higgins, Nelson, and Tulving--argue that these types of cognitive abilities are uniquely human, whereas others--Call, Hampton, Kinsbourne, Menzel, Metcalfe, Schwartz, Smith, and Terrace--are convinced that at least the precursors to self-reflective consciousness exist in non-human primates. Their debate focuses primarily on the underpinnings of consciousness. Some of the participants believe that consciousness depends on representational thought and on the mental manipulation of such representations. Is representational thought enough to ensure consciousness, or does one need more? If one needs more, exactly what is needed? Is reflection upon the representations, that is, metacognition, the link? Does a realization of the contingencies, that is, knowing that, in Gilbert Ryle's terminology, ensure that a person or an animal is conscious? Is true episodic memory needed for consciousness, and if so, do any animals have it? Is it possible to have episodic memory or, indeed, any self-reflective processing, without language? Other participants believe that consciousness is inextricably intertwined with a sense of self or self-awareness. From where does this sense of self or self-awareness arise? Some of the participants believe that it develops only through the use of language and the narrative form. If it does develop in this way, what about claims of a sense of self or self-awareness in non-human animals? Others believe that the autobiographical record implied by episodic memory is fundamental. To what extent must non-human animals have the linguistic, metacognitive, and/or representational abilities to develop a sense of self or self-awareness? These and other related concerns are crucial in this volume's lively debate over the nature of the missing cognitive link, and whether gorillas, chimps, or other species might be more like humans than many have supposed.

The Evolutionary Road to Human Memory Elisabeth A. Murray, Steven P. Wise, Mary K. L. Baldwin, Kim S. Graham,2019-12-05 We tend to think about memory in terms of the human experience, neglecting the fact that we can trace a direct line of descent from the earliest vertebrates to modern humans. But the evolutionary history that we share with other vertebrates has left a mark on modern memory, complemented by unique forms of memory that emerged in humans. This book tells an intriguing story about how evolution shaped human memory. It explains how a series of now-extinct ancestral species adapted to life in their world, in their time and place. As they did, new brain areas appeared, each of which supported an innovative form of memory that helped them gain an advantage in life. Through inheritance and modification across millions of years, these evolutionary developments created several kinds of memory that influence the human mind today. Then, during human evolution, yet another new kind of memory emerged: about ourselves and others. This evolutionary innovation ignited human imagination; empowered us to remember and talk about a personal past; and enabled the sharing of knowledge about our world, our culture, and ourselves. Through these developments, our long journey along the evolutionary road to human memory made it possible for every individual, day upon day, to add new pages to the story of a life: the remarkably rich record of experiences and knowledge that make up a human mind. Written in an engaging and accessible style, *The Evolutionary Road to Human Memory* will be enjoyable reading for anyone interested in the human mind.

Handbook of Developmental Cognitive Neuroscience Charles Alexander Nelson (III), Monica Luciana Collins,2001 An overview of the new techniques that account for the progress and heightened activity in developmental cognitive science research.

Dorsolateral Prefrontal Cortex Shintaro Funahashi,2022-12-13 The prefrontal cortex is known to play important roles for performing a variety of higher cognitive functions. Among regions of the prefrontal cortex, the dorsolateral prefrontal cortex plays the most important roles for these functions. This book focuses on functions of the dorsolateral prefrontal cortex, summarizes research results obtained mainly by non-human primate studies,

and describes neural mechanisms of executive functions that the dorsolateral prefrontal cortex participates. First, to understand the feature of the dorsolateral prefrontal cortex and how its function has been understood, anatomical and functional features of the dorsolateral prefrontal cortex and historical overview of prefrontal functions are described. To understand functions of the prefrontal cortex and neural mechanisms of executive functions, working memory is an important concept and sustained activation during the memory period of working memory tasks is known as a neural mechanism of working memory. Therefore, this book describes features of sustained memory-related activity based on neurophysiological results obtained in the prefrontal cortex and how memory-related activity contributes to executive functions including control of attention, inhibitory control, task management, and planning. And further, this book describes how the dorsolateral prefrontal cortex contributes to neural mechanisms for sensory and motor processing, memory control in multi-task performance, decision-making, metacognition, and top-down control. Thus, this book provides important information regarding neural mechanisms of dorsolateral prefrontal functions to neuroscientists and helps to plan further investigation to understand prefrontal functions in primates and human subjects.

Animal Wise Virginia Morell, 2013 Explores the frontiers of research on animal cognition and emotion, offering a surprising examination into the hearts and minds of wild and domesticated animals.

The Chimp Paradox Steve Peters, 2013-05-30 Your inner Chimp can be your best friend or your worst enemy...this is the Chimp Paradox Do you sabotage your own happiness and success? Are you struggling to make sense of yourself? Do your emotions sometimes dictate your life? Dr. Steve Peters explains that we all have a being within our minds that can wreak havoc on every aspect of our lives—be it business or personal. He calls this being the chimp, and it can work either for you or against you. The challenge comes when we try to tame the chimp, and persuade it to do our bidding. The Chimp Paradox contains an incredibly powerful mind management model that can help you be happier and healthier, increase your confidence, and become a more successful person. This book will help you to: —Recognize how your mind is working —Understand and manage your emotions and thoughts —Manage yourself and become the person you would like to be Dr. Peters explains the struggle that takes place within your mind and then shows you how to apply this understanding. Once you're armed with this new knowledge, you will be able to utilize your chimp for good, rather than letting your chimp run rampant with its own agenda.

Are We Smart Enough to Know How Smart Animals Are? Frans de Waal, 2016-04-25 A New York Times bestseller: A passionate and convincing case for the sophistication of nonhuman minds. —Alison Gopnik, *The Atlantic* Hailed as a classic, *Are We Smart Enough to Know How Smart Animals Are?* explores the oddities and complexities of animal cognition—in crows, dolphins, parrots, sheep, wasps, bats, chimpanzees, and bonobos—to reveal how smart animals really are, and how we've underestimated their abilities for too long. Did you know that octopuses use coconut shells as tools, that elephants classify humans by gender and language, and that there is a young male chimpanzee at Kyoto University whose flash memory puts that of humans to shame? Fascinating, entertaining, and deeply informed, de Waal's landmark work will convince you to rethink everything you thought you knew about animal—and human—intelligence.

The Evolution of Memory Systems Elisabeth A. Murray, Steven P. Wise, Kim S. Graham, 2017 Current theories about human memory have been shaped by clinical observations and animal experiments. This doctrine holds that the medial temporal lobe subserves one memory system for explicit or declarative memories, while the basal ganglia subserves a separate memory system for implicit or procedural memories, including habits. Cortical areas outside the medial temporal lobe are said to function in perception, motor control, attention, or other aspects of executive function, but not in memory. 'The Evolution of Memory Systems' advances dramatically different ideas on all counts. It proposes that several memory systems arose during evolution and that they did so for the same general reason: to transcend problems and exploit opportunities encountered by specific ancestors at particular times and

places in the distant past. Instead of classifying cortical areas in terms of mutually exclusive perception, executive, or memory functions, the authors show that all cortical areas contribute to memory and that they do so in their own ways—using specialized neural representations. The book also presents a proposal on the evolution of explicit memory. According to this idea, explicit (declarative) memory depends on interactions between a phylogenetically ancient navigation system and a representational system that evolved in humans to represent one's self and others. As a result, people embed representations of themselves into the events they experience and the facts they learn, which leads to the perception of participating in events and knowing facts. 'The Evolution of Memory Systems' is an important new work for students and researchers in neuroscience, psychology, and biology.

Animal Models of Cognitive Impairment Edward D. Levin, Jerry J. Buccafusco, 2006-06-22 The costs associated with a drug's clinical trials are so significant that it has become necessary to validate both its safety and efficacy in animal models prior to the continued study of the drug in humans. Featuring contributions from distinguished researchers in the field of cognitive therapy research, *Animal Models of Cognitive Impairment* examines some of the most popular and successful animal archetypes used in the context of drug discovery. It provides integrated coverage of the latest research concerning neuronal systems relevant to cognitive function and dysfunction, assimilating reviews of this research within the context of each chapter. This approach is unique in that it brings together molecular and neurochemical methodologies, behavioral applications in translational models, and clinical applications. The book comprehensively discusses a wide variety of animal models of cognitive impairment, including genetic, lesion, pharmacological, and aging related impairments. It also explores the significance of this research in regards to the treatment of various addictions and disorders such as stroke, autism, Alzheimer's, schizophrenia, and ADHD. Edited by two renowned authorities in the field, *Animal Models of Cognitive Impairment* is a timely book that provides integrated coverage of cutting-edge research that concerns neuronal systems relevant to cognitive function and dysfunction.

How Animals Think and Feel Ken Cheng, 2016-10-03 This highly accessible book explains key scientific findings in the areas of animal cognition, emotion, and behavior in easy-to-understand language. Why do dogs get separation anxiety? Can a chimpanzee recognize itself in a mirror? Do animals in a zoo get neurotic? Do animals actually have emotions, or are humans simply anthropomorphizing them? *How Animals Think and Feel: An Introduction to Non-Human Psychology* answers these interesting questions and many more in its examination of animal psychology—particularly non-human primates (our closest relatives) and companion animals (the animals with which we spend the most time). Readers will learn about the history of the study of animals as well as the methodologies and applications of animal research, examples of higher-level thought and problem solving in animals, learning and memory, emotion, and basic behaviors such as feeding and mating. Chapters examine specific animal species or groups in greater depth to address particular behaviors and discuss characteristic traits. The book also includes sidebars that offer additional high-interest, ready-reference content; a bibliography of print and electronic sources for further study; and a glossary of unfamiliar terms.

Cognitive Processes of Nonhuman Primates Leonard Jarrard, 2012-12-02 *Cognitive Processes of Nonhuman Primates* covers the proceedings of the Sixth Annual Symposium on Cognition, held at Carnegie-Mellon University on March 26 and 27, 1970. The symposium focuses on the status of research dealing with complex behavioral processes of monkeys and apes, providing insights into complex behavior of human and nonhuman primates. Composed of nine chapters, this book covers short-term memory in the monkey and how this relates to human short-term memory. A chapter compares memory deficits that accompany brain dysfunction in animals and man. The following chapters discuss the analysis of the development of language in a young female chimpanzee and the cogent analysis of interaction between habits and concepts in the monkey. The effects of early deprived and enriched environment on later complex behavioral processes of monkeys are also explained. Moreover, this book goes on examining the nonhuman brain capacities and the continuities with human behavior. It also discusses important research comparing delayed-response performance of several species of monkeys, age groups of children, and adults. The book will be of great help to scientists, researchers, teachers, and students who are interested in cognition processes and memory of nonhuman primates and humans.

The Invisible Gorilla Christopher Chabris, Daniel Simons, 2011-06-07 Reading this book will make you less sure of yourself—and that's a good thing. In *The Invisible Gorilla*, Christopher Chabris and Daniel Simons, creators of one of psychology's most famous experiments, use remarkable stories and counterintuitive scientific findings to demonstrate an important truth: Our minds don't work the way we think they do. We think we see ourselves and the world as they really are, but we're actually missing a whole lot. Chabris and Simons combine the work of other researchers with their own findings on attention, perception, memory, and reasoning to reveal how faulty intuitions often get us into trouble. In the process, they explain: • Why a company would spend billions to launch a product that its own analysts know will fail • How a police officer could run right past a brutal assault without seeing it • Why award-winning movies are full of editing mistakes • What criminals have in common with chess masters • Why measles and other childhood diseases are making a comeback • Why money managers could learn a lot from weather forecasters Again and again, we think we experience and understand the world as it is, but our thoughts are beset by everyday illusions. We write traffic laws and build criminal cases on the assumption that people will notice when something unusual happens right in front of them. We're sure we know where we were on 9/11, falsely believing that vivid memories are seared into our minds with perfect fidelity. And as a society, we spend billions on devices to train our brains because we're continually tempted by the lure of quick fixes and effortless self-improvement. *The Invisible Gorilla* reveals the myriad ways that our intuitions can deceive us, but it's much more than a catalog of human failings. Chabris and Simons explain why we succumb to these everyday illusions and what we can do to inoculate ourselves against their effects. Ultimately, the book provides a kind of x-ray vision into our own minds, making it possible to pierce the veil of illusions that clouds our thoughts and to think clearly for perhaps the first time.

Behavioral Neuroscience of Learning and Memory Robert E. Clark, Stephen Martin, 2018-03-27 'Behavioral Neuroscience of Learning and Memory' brings together the opinions and expertise of some of the world's foremost neuroscientists in the field of learning and memory research. The volume provides a broad coverage of contemporary research and thinking in this field, focusing both on well established topics such as the medial temporal lobe memory system, as well as emerging areas of research such as the role of memory in decision making and the mechanisms of perceptual learning. Key intersecting themes include the molecular and cellular mechanisms of memory formation, the multiplicity of memory systems in the brain, and the way in which technological innovation is driving discovery. Unusually for a volume of this kind, this volume brings together research from both humans and

animals—often relatively separate areas of discourse—to give a more comprehensive and integrated view of the field. The book will be of interest to both established researchers who wish to broaden their knowledge of topics outside of their specific areas of expertise, and for students who need a resource to help them make sense of the vast scientific literature on this subject.

Handbook of the Neuroscience of Aging Patrick R. Hof, Charles V. Mobbs, 2010-05-22 A single volume of 85 articles, the Handbook of the Neurobiology of Aging is an authoritative selection of relevant chapters from the Encyclopedia of Neuroscience, the most comprehensive source of neuroscience information assembled to date (AP Oct 2008). The study of neural aging is a central topic in neuroscience, neuropsychology and gerontology. Some well-known age-related neurological diseases include Parkinson's and Alzheimer's, but even more common are problems of aging which are not due to disease but to more subtle impairments in neurobiological systems, including impairments in vision, memory loss, muscle weakening, and loss of reproductive functions, changes in body weight, and sleeplessness. As the average age of our society increases, diseases of aging become more common and conditions associated with aging need more attention by doctors and researchers. This book offers an overview of topics related to neurobiological impairments which are related to the aging brain and nervous system. Coverage ranges from animal models to human imaging, fundamentals of age-related neural changes and pathological neurodegeneration, and offers an overview of structural and functional changes at the molecular, systems, and cognitive levels. Key pathologies such as memory disorders, Alzheimer's, dementia, Down syndrome, Parkinson's, and stroke are discussed, as are cutting edge interventions such as cell replacement therapy and deep brain stimulation. There is no other current single-volume reference with such a comprehensive coverage and depth. Authors selected are the internationally renowned experts for the particular topics on which they write, and the volume is richly illustrated with over 100 color figures. A collection of articles reviewing our fundamental knowledge of neural aging, the book provides an essential, affordable reference for scientists in all areas of Neuroscience, Neuropsychology and Gerontology. * The most comprehensive source of up-to-date data on the neurobiology of aging, review articles cover: normal, sensory and cognitive aging; neuroendocrine, structural and molecular factors; and fully address both pathology and intervention * Chapters represent an authoritative selection of relevant material from the most comprehensive source of information about neuroscience ever assembled, (Encyclopedia of Neuroscience), synthesizing information otherwise dispersed across a number of journal articles and book chapters, and saving researchers the time consuming process of finding and integrating this information themselves * Offering outstanding scholarship, each chapter is written by an expert in the topic area and over 20% of chapters feature international contributors, (representing 11 countries) * Provides more fully vetted expert knowledge than any existing work with broad appeal for the US, UK and Europe, accurately crediting the contributions to research in those regions * Fully explores various pathologies associated with the aging brain (Alzheimer's, dementia, Parkinson's, memory disorders, stroke, Down's syndrome, etc.) * Coverage of disorders and key interventions makes the volume relevant to clinicians as well as researchers * Heavily illustrated with over 100 color figures
