*Can We Avoid Another Financial Crisis?* Steve Keen, 2017-05-09 The Great Financial Crash had cataclysmic effects on the global economy, and took conventional economists completely by surprise. Many leading commentators declared shortly before the crisis that the magical recipe for eternal stability had been found. Less than a year later, the biggest economic crisis since the Great Depression erupted. In this explosive book, Steve Keen, one of the very few economists who

anticipated the crash, shows why the self-declared experts were wrong and how ever-rising levels of private debt make another financial crisis almost inevitable unless politicians tackle the real dynamics causing financial instability. He also identifies the economies that have become 'The Walking Dead of Debt', and those that are next in line - including Australia, Belgium, China, Canada and South Korea. A major intervention by a fearlessly iconoclastic figure, this book is essential reading for anyone who wants to understand the true nature of the global economic system.

**Architecting Web Services** William Oellermann, 2001-09-01 Architecting Web Services is targeted toward developers and technical architects who have heard about, and even started to work with, Web services. The book starts with a background on the evolution of Web services and their significance to future collaborative efforts via the Internet. It then reveals the architecture for Web services and the various relationships that can be established through their consumption. Following a short technical primer on XML and related technologies, the Web services model is outlined to illustrate the decisions that have to be made in the areas of presentation, interface, and security before the design is even started. Topics ranging from content to state management to system infrastructures are discussed to help you understand the options and the pitfalls when developing robust Web services. The life cycle of implementing Web services from start to finish is illustrated, taking existing processes and exposing their functionality through Web services. Examples extend both Java and COM objects as Web services before exposing an entire hotel reservation system through a Web services workflow. These exercises are followed by three application scenarios that consume these Web services, again with both Java and Visual Basic/ASP examples. Discussions cover the design, implementation, and testing of each solution to ensure a successful result. Finally, the book takes a look ahead at the future of Web services by examining both the current strategies of the primary vendors and the standards initiatives that are presently

under way. A companion website provides all the source code, and hosts the Web services and sample applications introduced in the book.

How to Refinance Your Mortgage and Loans Theo Katz, 2013-08-12 What You Need to Know About a Mortgage Loan In wanting to have your own home, you have to take one of the biggest financial decisions in your life. Unless you are going to purchase a real property in cold cash, you need to have the financial means to be able to pay for your mortgage. Before you finally get a house, it is crucial that you get to understand the mortgage process and procedures as well as the details pertaining to the interest rates and other terms and conditions. This allows you to choose the right mortgage loan that suits your financial capacity and your other needs. What is Mortgage? In a

nutshell, mortgage is a long-term loan for borrowers who want to purchase a real estate property. With the help of a mortgage loan, you have the affordable means to own a house where you pay the principal amount of the loan plus the interest payments depending on the interest rate and the terms. To further understand your mortgage, you need to know how it functions and how you actually pay for it. Components of a Mortgage Payment Mortgage payments depend on factors like the amount of money to be borrowed and the term, which refers to the length of time you intend to fully pay back your mortgage loan. Longer terms allow you to pay lower monthly payments. But you can expect that you will have higher costs when you sum up the principal amount and the interest rates. Since long terms like the 30-year mortgage are affordable, many clients prefer to have this mortgage package. Now, how do you go about the calculation of a mortgage payment? Once you have determined the amount of money you intend to borrow and the terms, there are now four factors that come into play: the principal amount, interest, taxes and insurance. Principal Every mortgage payment is allotted for the repayment of the principal. If you take a \$500,000 mortgage, the principal amount that you have to pay is \$500,000. The loan is just structured in such a way that the starting years are dedicated for primarily interest payments while the final years consist mainly of principal repayment. Interest The bulk comprising your mortgage payment would consist of interest payments. The higher the interest rates mean that you have to pay for higher mortgage payments. As such, many people want to take advantage of a low interest rate on a mortgage. Other factors that can affect your mortgage payments include the insurance and the real estate taxes, which are then calculated by the government.

**Calculator Mathematics for the Real Estate Professional** Lawrence R. Rosen, 1978

Calculator Mathematics for the Real Estate Professional has two objectives: 1) to show you how to correctly answer the mathematics questions on a real estate licensing examination for salespersons or brokers; 2) to be a time-saving reference for real estate professionals, investors, tenants, accountants, lenders, and attorneys. Even those who are capable of performing complex mathematical computations will welcome the practicality of having the formulas and methods contained in one easy-to-use reference and will benefit from the short-cut, time-saving techniques described, including—how to determine in seconds (without handbooks or tables) the monthly payment on a mortgage loan, the outstanding loan balance at any particular point in time, or the interest portion of mortgage payments for a given year. The first ten chapters explain the various computations one will encounter in licensing examinations and everyday practice. The last three chapters describe how to use a pocket calculator to quickly solve these computations, and provide the method of solving more complex and advanced problems such as: computation of the area of unusually shaped land areas and the various calculations related to ‘balloon mortgages. Examples are given for an algebraic language calculator and a reverse Polish calculator as well as for a basic four function model. Real estate practitioners who master the time-saving skills explained will increase their productivity, listings, commissions, and professionalism.
