Python Passive Network Mapping Chet Hosmer, 2015-06-10 Python Passive Network Mapping: P2NMAP is the first book to reveal a revolutionary and open source method for exposing nefarious network activity. The Heartbleed vulnerability has revealed significant weaknesses within enterprise environments related to the lack of a definitive mapping of network assets. In Python Passive Network Mapping, Chet Hosmer shows you how to effectively and definitively passively map networks. Active or probing methods to network mapping have traditionally been used, but they have many drawbacks - they can disrupt operations, crash systems, and - most importantly - miss critical nefarious activity. You require an accurate picture of the environments you protect and operate in order to rapidly investigate, mitigate, and then recover from these new attack vectors. This book gives you a deep understanding of new innovations to passive network mapping, while delivering open source Python-based tools that can be put into practice immediately. Python Passive Network Mapping is for practitioners, forensic investigators, IT teams, and individuals who work together when performing incident response and investigating potential damage, or are examining the impacts of new malware threats. Those defending critical infrastructures will have a special interest in this book, as active or probing methods of network mapping are rarely used within these environments as any resulting impacts can be disastrous. Python Passive Network Mapping is ideally suited for use as a text in a variety of academic programs to expose and engage students in the art of passively mapping enterprise networks, with the added benefit of providing exposure to open source Python solutions. First book to show you how to use open source Python to conduct passive network mapping Provides a new method for conducting incident response and investigating the extent of potential damage to your systems Python code forensics toolkit for network mapping included on the companion website

Comparative Analysis of Active and Passive Mapping Techniques in an Internet-Based Local Area Network James B. Kuntzelman, 2004-03-01 Network mapping technologies allow quick and easy discovery of computer systems throughout a network. Active mapping methods, such as using nmap, capitalize on the standard stimulus-response of network systems to probe target systems. In doing so, they create extra traffic on the network, both for the initial probe and for the target system's response. Passive mapping methods work opportunistically, listening for network traffic as it transits the system. As such, passive methods generate minimal network traffic overhead. Active methods are still standard methods for network information gathering; passive techniques are not normally used due to the possibility of missing important information as it passes by the sensor. Configuring the network for passive network mapping also involves more network management. This research explores the implementation of a prototype passive network mapping system, lanmap, designed for use within an Internet Protocol-based local area network. Network traffic is generated by a synthetic traffic generation suite using honeyd and syntraf, a custom Java program to interact with honeyd. lanmap is tested against nmap to compare the two techniques. Experimental results show that lanmap is quite effective, discovering an average of 76.1% of all configured services (server- and client-side) whereas nmap only found 27.6% of all configured services. Conversely, lanmap discovered 19.9% of the server services while nmap discovered 92.7% of the configured server-side services. lanmap discovered 100% of all client-side service consumers while nmap found none. lanmap generated an average of 200 packets of network overhead while nmap generated a minimum of minimum 8,600 packets on average? up to 155,000 packets at its maximum average value. The results show that given the constraints of the test bed, passive network mapping is a viable alternative to active network mapping, unless the mapper is looking for server-side services.
