Networking 101 Uyless D. Black,2002 Thousands of non-technical professionals and sophisticated Web and computer users are looking for a deeper understanding of networks and the Internet -- but most books on the subject are either too technical or too superficial. In this book, leading networking consultant Uyless Black draws on his renowned introductory course on networking, presenting the fundamentals in simple, non-technical terms any intelligent reader can understand -- without compromising accuracy. Black begins with the absolute basics, explaining the differences (and similarities) between human and machine communications, and between analog and digital communications. He introduces the key concepts and characteristics of voice and data traffic, demonstrating how connections are made and maintained in networks, and how networks have been integrated into the global Internet. Among the topics covered: analog and digital signaling systems, routing, the Web, network identification schemes such as IP addressing and the Domain Name System, the role of Internet Service Providers, and much more. For a wide range of professionals and sophisticated laypersons who want to cut through the buzzwords and complexity -- and truly understand networking and the Internet.

Big Data, Databases and "Ownership" Rights in the Cloud Marcelo Corrales Compagnucci, 2019-11-02 Two of the most important developments of this new century are the emergence of cloud computing and big data. However, the uncertainties surrounding the failure of cloud service providers to clearly assert ownership rights over data and databases during cloud computing transactions and big data services have been perceived as imposing legal risks and transaction costs. This lack of clear ownership rights is also seen as slowing down the capacity of the Internet market to thrive. Click-through agreements drafted on a take-it-or-leave-it basis govern the current

state of the art, and they do not allow much room for negotiation. The novel contribution of this book proffers a new contractual model advocating the extension of the negotiation capabilities of cloud customers, thus enabling an automated and machine-readable framework, orchestrated by a cloud broker. Cloud computing and big data are constantly evolving and transforming into new paradigms where cloud brokers are predicted to play a vital role as innovation intermediaries adding extra value to the entire life cycle. This evolution will alleviate the legal uncertainties in society by means of embedding legal requirements in the user interface and related computer systems or its code. This book situates the theories of law and economics and behavioral law and economics in the context of cloud computing and takes database rights and ownership rights of data as prime examples to represent the problem of collecting, outsourcing, and sharing data and databases on a global scale. It does this by highlighting the legal constraints concerning ownership rights of data and databases and proposes finding a solution outside the boundaries and limitations of the law. By allowing cloud brokers to establish themselves in the market as entities coordinating and actively engaging in the negotiation of service-level agreements (SLAs), individual customers as well as small and medium-sized enterprises could efficiently and effortlessly choose a cloud provider that best suits their needs. This approach, which the author calls “plan-like architectures,” endeavors to create a more trustworthy cloud computing environment and to yield radical new results for the development of the cloud computing and big data markets.
