Dewey Knives Robert Dewey,John Dunn,2013-08-12 This book has something of interest for all knife users including hunters, campers, fishermen, home cooks, chefs, students and meat workers. It is a collection of the many articles Robert Dewey has written over the years. Also included are a number of reviews by John Dunn, the Editor. Robert recommends standards of performance and explains the components and features that, put together, produce a quality knife. He also recommends the sharpening techniques to obtain that ultimate finish. His advice, when followed, will bring joy to all those who struggle with their domestic knives and to hunters who would like to achieve skinning outcomes to match the example given. There is a thoughtful look at knife design with reasons given as to the why of most, if not all, knife features. It will be of interest to collectors who value quality, function and simple designs.

The Molecular and Cellular Basis of Retinal Diseases Steven J. Pittler ,Steven J. Fliesler,2020-12-29 There are more than 300 genes that have been identified which carry mutations that cause various forms of retinal dysfunction and degeneration, making the study of retinal diseases a subject of high relevance. In this compendium of original and review articles, many of the diseases and pathways associated with disorders of the retina are examined using animal models, to provide the reader with a good overview of current retinal research. Within this volume, you will find research reports on many of the

most prominent retinal disorders, such as diabetic retinopathy (DR), age-related macular degeneration (AMD), choroidal neovascularization (CNV), and retinitis pigmentosa (RP). We hope that the work presented here will stimulate new ideas and lead to effective treatments for retinal diseases.

Correlative Light and Electron Microscopy II, 2014-09-30 This new volume of *Methods in Cell Biology* looks at methods for analyzing correlative light and electron microscopy (CLEM). With CLEM, people try to combine the advantages of both worlds, i.e. the dynamics information obtained by light microscopy and the ultrastructure as provided by electron microscopy. This volume contains the latest techniques on correlative microscopy showing that combining two imaging modalities provides more than each technique alone. Most importantly it includes the essential protocols, including tips, tricks and images for you to repeat these exciting techniques in your own lab. With cutting-edge material, this comprehensive collection is intended to guide researchers for years to come. Covers sections on model systems and functional studies, imaging-based approaches and emerging studies Chapters are written by experts in the field Cutting-edge material Second of two volumes dedicated to Correlative Light and Electron microscopy (CLEM)

Death and Dying in New Mexico Martina Will, 2022-06-30 In this exploration of how people lived and died in eighteenth- and nineteenth- century New Mexico, Martina Will weaves together the stories of individuals and communities in this cultural crossroads of the American Southwest. The wills and burial registers at the heart of this study provide insights into the variety of ways in which death was understood by New Mexicans living in a period of profound social and political transitions. This volume addresses the model of the good death that settlers and friars brought with them to New Mexico, challenges to the model's application, and the eventual erosion of the ideal. The text also considers the effects of public health legislation that sought to protect the public welfare, as well as responses to these controversial and unpopular reforms. Will discusses both cultural continuity and regional adaptation, examining Spanish-American deathways in New Mexico during the colonial (approximately 1700–1821), Mexican (1821–1848), and early Territorial (1848–1880) periods.

Spores and Spore Formers Imrich Barák, Simon M. Cutting, Ezio Ricca, Neil Fairweather, Ivan Mijakovic, 2017-08-15 Bacterial spore formers have been the focus of intense study for almost half a century centered primarily on *Bacillus subtilis*. This research has given us a detailed picture of the genetic, physiological and biochemical mechanisms that allow bacteria to survive harsh environmental conditions by forming highly robust spores. Although, many basic aspects of this process are now understood in great detail, bacterial sporulation still continues to be a highly attractive model for studying various cell processes at a molecular level. There are several reasons for such scientific interest. First, some of the complex steps in sporulation are not fully understood and/or only are

only described by 'controversial' models. Second, intensive research on unicellular development of a single microorganism, *B. subtilis*, left us largely unaware of the multitude of diverse sporulation mechanisms in many other Gram-positive endospore and exospore formers. This diversity would likely increase if we were to include sporulation processes in the Gram-negative spore formers. In addition, spore formers have great potential in applied research. Spore forming bacteria are becoming increasingly important in the areas of probiotics, vaccine technology and biotechnology. This Research Topic in Frontiers in Microbiology details the most recent advances in basic science of spore research and cover also emerging areas of scientific importance involving the use of spores.

Glioma Ibrahim Omerhodzic, Kenan Arnautovic, 2019-01-16 The past three decades have been marked with huge enthusiasm from scientists and professionals in an effort to find a cure for glioma disease. Methods to confirm the kinds and grades of glioma have taken a path from classical macro- to microscopic pathohystological confirmation of tumors, through morphological-histological, molecular, and genetic diagnosis. Surgically, progress was made possible with the development and use of technological aids, for example neuronavigation, cortical mapping, electrocorticography, neuromonitoring, functional and intraoperative MRI, magnetoencephalography, etc. Great hope was placed on the extension of tumor resection and popular supratotal resection. Significant progress has been made generally in glioma treatment with the use of modern radiotherapy and new chemotherapeutics. What do we want to see for the future? By way of stem cells, a specific medicine will be produced, individualized for the particular patient, and by using a microcapsule it will be implanted into the brain zone affected by the tumor by way of robot surgery and injection needle. This is not at all an unrealistic expectation in the next decade or two.
