Pediatric Formulations Daniel Bar-Shalom,Klaus Rose,2014-01-30 Until the 1990s, it was generally accepted that medicines were first developed for adults and their use in children was investigated later, if at all. One of the main tasks of hospital pharmacies was the manufacturing of child-appropriate formulations in a more or less makeshift way. The first change came in 1997 with U.S. legislation that rewarded manufacturers to do voluntary pediatric research. Ten years later, the European Union passed legislation that required manufacturers to discuss all pediatric aspects, including formulations, with the regulatory authorities as a condition of starting the registration procedure. In consequence, manufacturers must now cover all age groups, including the youngest ones. So far, pediatric formulations were more a focus for academic researchers. Through the changed regulatory environment, there is now a sudden high commercial demand for age-appropriate formulations. This book begins by highlighting the anatomical, physiological and developmental differences between adults and children of different ages. It goes on to review the existing technologies and attempts to draw a roadmap to better, innovative formulations, in particular for oral administration. The regulatory, clinical, ethical and pharmaceutical framework is also addressed.

The Management of Acute Respiratory Infections in Children World Health Organization, 1995 A step-by-step guide to the correct management of respiratory infections in infants and young children. Addressed to staff in first-level health facilities, the book explains how to assess a child, recognize symptoms, classify the illness, and provide appropriate treatment, whether involving immediate referral to hospital, treatment with antibiotics at home, or simple home care. Throughout, a special effort is made to help staff distinguish the few, very sick children from the many others whose infections can be safely treated at home. The manual also aims to help prevent deaths from pneumonia and other severe illnesses by offering abundant advice on the recognition and urgent management of danger signs. The manual has two parts, each based on the use of a quick-reference case management chart, reproduced in a foldout version. Part one covers the management of pneumonia, wheezing, coughs and colds. Advice on how to collect essential information about the signs of respiratory problems is followed by a description of the steps involved in classifying the illness, determining the degree of severity, and identifying the appropriate treatment. Part one concludes with detailed treatment instructions, including how to give an antibiotic and treat fever and wheezing. Part two explains how to assess, classify, and treat the child with an ear problem or sore throat. Treatment instructions include advice on how to dry the ear by wicking, give an antibiotic, and manage streptococcal sore throat. Further practical information is provided in a series of annexes, which explain how to refer a child to hospital, what to do when referral is not feasible, how to use a rapid-acting bronchodilator, and how to determine whether complaints and symptoms are due to measles, pertussis, or diphtheria.

Paediatric Formulation Nunzio Denora, Antonio Lopalco, 2021-09-02 The development of paediatric medicines can be challenging since this is a different patient population with specific needs. A medicine designed for use in paediatric patients must consider the following aspects: patient population variability; the need for dose flexibility; route of administration; patient compliance; excipient tolerability. For example, the toxicity of excipients may differ in children compared to adults and children have different taste preferences. Globally, about 75% of drugs do not carry regulatory approval for use in children; worldwide, many medications prescribed for the treatment of paediatric diseases are used off-label, and less than 20% of package inserts have sufficient information for treating children. This book provides an update on both state-of-the-art methodology and operational challenges in paediatric formulation design and development. It aims at re-evaluating what is needed for more progress in the design and development of age-appropriate treatments for paediatric diseases, focusing on: formulation development; drug delivery design; efficacy, safety, and tolerability of drugs and excipients.
