Build Your Own Low-Power Transmitters Rudolf F.

Graf, William Sheets, 2001-08-24 Rudolf Graf and William Sheets have written a book containing twenty low-power (LP) transmitter projects, perfect for the electronics hobbyist and radio experimenter. Now that the FCC has changed its regulations about pirate transmissions, more and more people are setting up radio and video stations for broadcast from their homes. Build Your Own Low-Power Transmitters addresses applications for hobbyist broadcasting of AM, SSB, TV, FM Stereo and NBFM VHF-UHF signals with equipment the reader can build himself for thousands of dollars less than similar equipment sold on the retail market. The authors also fully explore the legal limits and ramifications of using the equipment as well as how to get the best performance for optimum range. The key advantage is referencing a low-cost source for all needed parts, including the printed circuit board, as well as the kit. Projects in the book include: LP FM stereo transmitter; digitally synthesized PLL FM stereo transmitter; LP AM transmitter for 150-1710 KHz; radio control transmitter/receiver; carrier current transmitter and AM and FM receivers; LP VHF one-way and two-way audio links; 1-watt 40-meter CW transmitter for ham radio use; SSB LP transmitter for 10-meter ham radio use; 2-meter VHF FM ham radio transmitter; FM video link for 900 MHz NTSC/PAL operation; 2-watt TV transmitters for 440, 900 and 1300 MHz amateur TV NTSC/PAL transmissions; linear amplifier for 440MHz, 10-15watt NTSC/PAL operation; Downconverters for 440, 900 and 1300 MHz with VHF channel 3 or 4 output; TV video receiving systems and AM-FM IF systems; LP video link for UHF channels 14-18; 1-watt CW beacon transmitter for Part 15 LF radio experimentation; CW identifier for transmitters; test equipment projects for LP transmitters; as well as an RF power meter and modulation monitor. Complete source information will be included to help each reader find the kits and parts they need to build these fascinating projects. Unique among comparable project books, this

one offers a low-cost source for all parts, including the printed circuit board. This allows immediate completion without needing to search for difficult to find parts Features twenty low-power transmitter projects

Chaotic Electronics in Telecommunications Michael Kennedy,Riccardo Rovatti,Gianluca Setti,2018-10-03 At the code level, discrete-time chaotic systems can be used to generate spreading codes for DS-SS systems. At the signal level, continuous-time chaotic systems can be used to generate wideband carriers for digital modulation schemes. The potential of chaos engineering is now recognized worldwide, with research groups actively pursuing the exploitation of chaotic phenomena in cryptography, spread spectrum communications, electromagnetic interference reduction, and many other applications. Although some noteworthy results have already been achieved, until now, the field has lacked both a systematic treatment of these developments and a careful, quantitative comparison of chaos-based and conventional techniques. Chaotic Electronics in Telecommunications fills both of those needs. It addresses the use of chaos in digital communications applications, from the coding level to circuit design. Each chapter offers a formal exposition of the theoretical and engineering tools needed to apply chaos, followed by discussion of the algorithms and circuits needed to apply the theory to real-world communications systems.

Wireless FM Bug Joshua Anquandah,2016-01-23 This book is for anybody wanting to make a wireless monitoring or surveillance device. It is very detailed research and knowledge to bless anyone who reads it. It is actually a thesis. The wireless FM bug is a sensitive miniature very high FM wireless microphone transmitter of the type Wide Band Frequency Modulation Wireless Microphone (WBFMWM). Basically, it serves as a detective device to secretly monitor conversation and can be used to detect lies. It can be considered as a surveillance device. This is a hardware project which involves RF (radio frequency) circuit design. What makes

the FM bug different from other devices is its wireless property. The FM bug receives sound waves preferably human voice through the microphone. The sound wave is converted into electrical energy and then back to audio signal at the output end. In view of that, there are three (3) stages (modules) involved in the implementation of the bug. They are the audio amplifier, FM oscillator and the RF buffer amplifier stages. The sound wave received through the microphone is amplified to a level that can be modulated over RF. The electromagnetic wave that is constantly generated at the FM oscillator stage is buffered with adequate power being supplied to be transmitted strongly through the antenna. Finally, the audio signal is output and retrieved from a broadcast radio FM. Purchase this book to find out more. This is a fantastic book on making a monitoring device.
