The Rapid Evaluation of Potential Fields in Particle Systems Leslie Greengard, 1988 The evaluation of Coulombic or gravitational interactions in large ensembles of particles is an integral part of the numerical simulation of a large number of physical processes. Examples include celestial mechanics, plasma physics, the vortex method in fluid dynamics, molecular dynamics, molecular dynamics, and the solution of the Laplace equation via potential theory. A numerical model follows the trajectories of a number of particles moving in accordance with Newton's second law of motion in a field generated by the whole ensemble. In many situations, in order to be of physical interest, the simulation has to involve thousands of particles (or more), and the fields have to be evaluated for a large number of configurations. Unfortunately, an amount of work of the order $O(N^2)$ has traditionally been required to evaluate all pairwise interactions in a system of N particles, unless some approximation or truncation method is used. Large scale simulations have been extremely expensive in some cases, and prohibitive in others. An algorithm is presented for the rapid evaluation of the potential and force fields in large scale systems of particles. To evaluate all pairwise Coulombic interactions of N particles to within round off error, the algorithm requires an amount of work proportional to N , and this estimate does not depend on the statistics of the distribution. Both two and three dimensional versions of the algorithm have been constructed. Applications to several problems in physics, chemistry, biology, and numerical complex analysis are discussed.

A Leadership Playbook for Addressing Rapid Change in Education Teresa L. San Martín, 2023-03-17 A Leadership Playbook for Addressing Rapid Change in Education provides educational leaders with a simple, step-by-step approach for addressing rapid change. Rapid Climate Change Scott G. McNall, 2012-08-06 The book reviews the science of climate change and explains why it is one of the most difficult problems humanity has ever tackled. Climate change is a wicked problem bound up with problems of population growth, environmental degradation, and world problems of growing social and economic inequality. The book explores the politicization of the topic, the polarization of opinion, and the reasons why, for some, science has become just another ideology to be contested. How do humans assess risk? Why are they are so bad at focusing on the future? How can we solve the problem of climate change? These are the questions this work answers. The goal of this new, unique Series is to offer readable, teachable thinking frames on today's social problems and social issues by leading scholars, all in short 60 page or shorter formats, and available for view on <http://routledge.customgateway.com/routledge-social-issues.html> For instructors teaching a wide range of courses in the social sciences, the Routledge Social Issues Collection now offers the best of both worlds: originally written short texts that provide overviews to important social issues as well as teachable excerpts from larger works previously published by Routledge and other presses.

Improvements to a Hybrid Algorithm for Rapid Generation of 3-D Optimal Launch Vehicle Ascent Trajectories Peter F.

Gath, 1999-12-15 Inhaltsangabe: Abstract: This thesis presents improvements to FLOAT, a hybrid analytical/numerical algorithm for rapid generation of three dimensional, optimal launch vehicle ascent trajectories. Improvements have been made to the terminal constraints, which are now available in a more general form to allow for an optimal attachment point to the target orbit. The existing algorithm also has been extended with logic that allows for vehicles with low thrust to weight ratios in the upper stage and successful convergence of problems with path constraints for normal force and angle of attack. Another major extension made to the code is the introduction of coasting arcs. Coasting arcs are implemented using a completely analytical solution for the prediction of states and costates as well as for the required sensitivity matrix. This allows for a very fast and accurate calculation even with long coasting arcs. Finally, an approach for the optimization of start and end time of coast arcs is presented. This approach was implemented and the results of a test case compare very well with results generated with OTIS for the same case. At the end, suggestions for future development are made.
