CSFS Ying Liu, 2003 In the twenty-first century, people are accustomed to using computers to deal with their daily

work and personal affairs. However, in an increasing number of computer applications in various fields, the security issue has become very important. By secure, we mean secrecy and tampering detection. Therefore, the issue of how to guaranty the security of computer applications comes up naturally. We need more secure and dependable software systems to provide stronger protection of our sensitive data. This thesis presents CINDI Secure File System (CSFS), which is based on the implementation of two secure systems. One is a simple Secure Database Management System (SGDBM), which deal with data and metadata uniformly. The Secure DBMS is based on the GNU Database Management System (GDBM) in Linux. The GDBM is transformed to be a secure database system by embedding encryption and hashing. The other is a Secure File System that is based on SGDBM previously mentioned. CSFS uses the SGDBM to store file passwords for the encrypted files. It provides a number of commands, which can be used in the same way as other basic commands in Linux, and a simple GUI application for the secure file operations.

Security of Mobile Communications Nouredine Boudriga,2009-07-27 The explosive demand for mobile communications is driving the development of wireless technology at an unprecedented pace. Unfortunately, this exceptional growth is also giving rise to a myriad of security issues at all levels-from subscriber to network operator to service provider. Providing technicians and designers with a critical and comprehens

Secure Semantic Service-Oriented Systems Bhavani Thuraisingham,2016-04-19 As the demand for data and information management continues to grow, so does the need to maintain and improve the security of databases, applications, and information systems. In order

to effectively protect this data against evolving threats, an up-to-date understanding of the mechanisms for securing semantic Web technologies is essential. Reviewing cutting-edge developments, *Secure Semantic Service-Oriented Systems* focuses on confidentiality, privacy, trust, and integrity management for Web services. It demonstrates the breadth and depth of applications of these technologies in multiple domains. The author lays the groundwork with discussions of concepts in trustworthy information systems and security for service-oriented architecture. Next, she covers secure Web services and applications—discussing how these technologies are used in secure interoperability, national defense, and medical applications. Divided into five parts, the book describes the various aspects of secure service oriented information systems; including confidentiality, trust management, integrity, and data quality. It evaluates knowledge management and e-business concepts in services technologies, information management, semantic Web security, and service-oriented computing. You will also learn how it applies to Web services, service-oriented analysis and design, and specialized and semantic Web services. The author covers security and design methods for service-oriented analysis, access control models for Web Services, identity management, access control and delegation, and confidentiality. She concludes by examining privacy, trust, and integrity, the relationship between secure semantic Web technologies and services, secure ontologies, and RDF. The book also provides specific consideration to activity management such as e-business, collaboration, healthcare, and finance.

massive growth of the Internet has made an enormous amount of information available to us. However, it is becoming very difficult for users to acquire an applicable one. Therefore, some techniques such as information filtering have been introduced to address this issue. Recommender systems filter information that is useful to a user from a large amount of information. Many e-commerce sites use recommender systems to filter specific information that users want out of an overload of information [2]. For example, Amazon.com is a good example of the success of recommender systems [1]. Over the past several years, a considerable amount of research has been conducted on recommendation systems. In general, the usefulness of the recommendation is measured based on its accuracy [3]. Although a high recommendation accuracy can indicate a user's favorite items, there is a fault in that only similar items will be recommended. Several studies have reported that users might not be satisfied with a recommendation even though it exhibits high recommendation accuracy [4]. For this reason, we consider that a recommendation having only accuracy is unsatisfactory. The serendipity of a recommendation is an important element when considering a user's long-term profits. A recommendation that brings serendipity to users would solve the problem of "user weariness" and would lead to exploitation of users' tastes. The viewpoint of the diversity of the recommendation as well as its accuracy should be required for future recommender systems.
