Mathematics Curriculum in Pacific Rim Countries

- China, Japan, Korea, and Singapore Zalman Usiskin, Edwin Willmore, 2008-09-01 This volume contains the proceedings of the First International Curriculum Conference sponsored by the Center for the Study of Mathematics Curriculum (CSMC). The CSMC is one of the National Science Foundation Centers for Learning and Teaching (Award No. ESI-0333879). The countries—China, Japan, Korea, and Singapore (in alphabetical order, which also happens to be the order of their populations)—have each been in the news because of their performance on international tests and/or their economic performance and potential. They also have centralized education ministries that create a single mathematics curriculum framework followed in the entire country. In all these countries, curricula are differentiated for students with different interests, usually around Grade 10 or 11. We think the reader will agree that the papers are of very high quality, befitting the standing of the individuals who were invited, but particularly notable for our international speakers because in three of these countries, English is not the speaker's first language. Following each paper, we have included a short biography of the author(s), so that the reader can understand the perspective of the paper's author.

Calculator in Upper Primary Mathematics Dr Yeap Ban Har, 2009-01-01 In an increasingly technological world, mathematics curricula around the world have responded accordingly. Tedious

computation, which is efficiently and accurately done using a simple calculator as well as more powerful software programmes, can no longer be the focus of any mathematics curriculum. In Singapore, the curriculum was recently revised to focus on the development and improvement of students' intellectual competence (Singapore Ministry of Education 2006). The ability to visualize and to look for connections are given more emphasis than the ability to do tedious computation. Research in the use of calculators in mathematics teaching and learning has generally concentrated on two areas. First, there have been metaanalyses of the effects of calculator use on student achievement. Second, there are several studies on teachers' beliefs on calculator use in the classroom. The metaanalyses of the effects of calculator use have found that there were improvements in computational, conceptual and problem-solving skills as well as in attitudes towards mathematics (Ellington, 2003; Hembree & Dessart, 1992). A study on instructional leaders showed that the majority of them agree with the research findings (Yeo, 2008). A study on practising teachers found that a majority of them did not believe that calculator use lowers students' achievement (Carter, Ferrucci & Yeap, 2008). In a press release to explain the move to introduce the use of calculators in examination in upper primary levels, it was announced that calculator use can facilitate exploration to discover patterns and to make generalizations as well as make the use of authentic data possible (Singapore Ministry of Education, 2007). Without calculator use, the repetitive computations needed

for students to discover patterns make this important aspect of mathematics learning tedious. Authentic data often involve numbers which may be difficult for students to deal with without calculators.
