Middleware Networks Michah Lerner,George Vanecek,Nino Vidovic,Dado Vrsalovic,2000-04-30 Middleware Networks: Concept, Design and Deployment of Internet Infrastructure describes a framework for developing IP Service Platforms and emerging managed IP networks with a reference architecture from the AT&T Labs GeoPlex project. The main goal is to present basic principles that both the telecommunications industry and the Internet community can see as providing benefits for service-related network issues. As this is an emerging technology, the solutions presented are timely and significant. Middleware Networks: Concept, Design and Deployment of Internet Infrastructure illustrates the principles of middleware networks, including Application Program Interfaces (APIs), reference architecture, and a model implementation. Part I begins with fundamentals of transport, and quickly transitions to modern transport and technology. Part II elucidates essential requirements and unifying design principles for the Internet. These fundamental principles establish the basis for consistent behavior in view of the explosive growth underway in large-scale heterogeneous networks. Part III demonstrates and explains the resulting architecture and implementation. Particular emphasis is placed upon the control of resources and behavior. Reference is made to open APIs and sample deployments. Middleware Networks: Concept, Design and Deployment of Internet Infrastructure is intended for a technical audience consisting of students, researchers, network professionals, software developers, system architects and technically-oriented managers involved in the definition and deployment of modern Internet platforms or services. Although the book assumes a basic technical competency, as it does not provide remedial essentials, any practitioner will find this useful, particularly those requiring an overview of the newest software architectures in the field.

Design for Services Dr Anna Meroni,Dr Daniela Sangiorgi,2012-09-28 In Design for Services, Anna Meroni and Daniela Sangiorgi articulate what Design is doing and can do for services, and how this connects to existing fields of knowledge and practice. Designers previously saw their task as the conceptualisation, development and production of tangible objects. In the twenty-first century, a designer rarely 'designs something' but rather 'designs for something': in the case of this publication, for change, better experiences and better services. The authors reflect on this recent transformation in the practice, role and skills of designers, by organising their book into three main sections. The first section links Design for Services to existing models and studies on services and service innovation. Section two presents multiple service design projects to illustrate and clarify the issues, practices and theories that characterise the discipline today; using these case studies the authors propose a conceptual framework that maps and describes the role of designers in the service economy. The final section projects the discipline into the emerging paradigms of a new economy to initiate a reflection on its future development.
