<u>The Business Text Message Connection</u> Dwayne Whiting,2014-08-31 A short 20 years ago, cell phone engineers scoffed at the idea of text messaging. Who would want to send a written message when they could just call on the phone? It seems public demand won over the engineers' doubts, and texting is here to stay. It's said that the first text message was sent via pager in 1989 by Raina Forteni: the string of numbers 07734, which, when her friend turned the pager upside down, read HELLO. True text messaging between cell phones didn't start happening until the mid-1990s, and it's only been since 2007 that a majority of mobile users are sending texts.

Mobile Messaging Technologies and Services Gwenaël Le Bodic,2003-06-13 Mobile messaging is practically the first data communication service in the wireless domain. It is a major advance on the conventional practice of providing only voice communication service over the wireless interface. Thus, mobile messaging is the initial step to bring the Internet to wireless terminals and has considerable importance both for mobile communication and the Internet. Mobile Messaging provides an in-depth description of messaging technologies supported by mobile networks. It covers the Short Message Service (SMS), Enhanced Messaging Service (EMS) through to the more complex and emerging Multimedia Messaging Service (MMS). The Short Message System (SMS) has proved to be incredibly popular and is supported by most GSM, TDMA and CDMA mobile networks. This volume focuses on the Short Message Service introduced by the European Telecommunications Standard Institute (ETSI) for GSM and GPRS networks. On the basis of ETSI standard, the 3rd Generation Partnership Project (3GPP) is currently the organisation responsible for maintaining the SMS technical specifications. In its most basic form, the Short Messaging Service allows users to exchange short messages composed of a limited amount of text and it is expected that up to 100 Billion short

messages could be exchanged monthly by the end of 2002. The Enhanced Message Service (EMS), an application-level extension of SMS, supersedes basic SMS features by allowing elements such as images, animations, formatted text and monophonic melodies to be inserted in short or concatenated messages. Recently, the 3GPP has been focusing on the development of the Multimedia Message Service (MMS). MMS features include the exchange of messages containing polyphonic melodies, large images, video elements sometimes organised with a multimedia presentation language such as SMIL or xHTML. MMS will be supported by 2.5 G and 3G networks. MMS specifications have reached a fairly mature stage and MMS commercial solutions are appearing on the market. Unlike EMS, MMS has been specified by the 3GPP as a service independent from the underlying network technologies. In parallel to the 3GPP standardisation process, other organisations have specified network-specific implementations of MMS such as the WAP implementation defined by the WAP Forum. In order to develop applications using Short, Enhanced and Multimedia messaging technologies, engineers have to become familiar with the use of technical specifications produced by various standard development organisations such as the 3GPP, the WAP Forum and the IETF and this is the first book to pull this vast array of material together. * Provides an in depth description of the different messaging services and messaging technologies * Presents an introduction to mobile networks * Features numerous practical implementation examples * Provides a unique easy-to-follow presentation of messaging services and mobile networks within a single publication Essential reading for content providers, service providers, network operators and telecommunications manufacturers, researchers, postgraduate students, marketing and standardisation personnel.

The Doctor Who Wasn't There Jeremy A. Greene,2022-10-26 The Doctor who wasn't there traces the long arc of enthusiasm for-and skepticism of-electronic media for health and medicine, showing that the same challenges now facing telehealth and the use of electronic medical records can be found in the medical reception of the telephone in the late nineteenth century and the radio, television, and mainframe computer across the twentieth. Wielding a rich trove of archival materials, physician/historian Jeremy Greene explores the role that new electronic media play, for better and for worse, in the past, present, and future of American health. Today's telehealth devices are far more sophisticated than the hook-and-ringer telephones that became widespread by the 1920s, the FM radio technologies used to broadcast health information in the 1940s, the televisions used to pioneer telemedical evaluation in the 1950s, or the first full-scale attempts to establish electronic medical records in the mid-1960s. But the ethical, economic, and logistical concerns they raise are prefigured in these earlier episodes, as are the gaps between what was promised and what was delivered. Each of these platforms produced subtle transformations in health and healthcare that we have learned to forget, displaced by promises of ever newer communications platforms to take their place. When is telemedicine good enough, and when is it not? And how do the uses of telemedical technologies

shape patient relationships with health care providers? Who benefits and who suffers when new technologies are adopted? And what do these communication technologies, whose promised revolutions have all failed, bring to our understanding of health and disease?--
