The Management of Eating Disorders and Obesity David J. Goldstein,1999-08-09 The mission of the Nutrition and Health Series of books is to provide health professionals with texts that are considered essential, because each book includes (1) a synthesis of the state of the science, (2) timely, in-depth reviews by the leading researchers in their respective fields, (3) extensive, up-to-date-fully annotated reference list, (4) a detailed index, (5) relevant tables and figures, (6) identification of paradigm shifts and their consequences, (7) virtually no overlap of information between chapters, but targeted interchapter referrals, (8) suggestions of areas for future research, and (9) balanced, data driven answers to patients' questions, which are based on the totality of evidence rather than the findings of any single study. The series volumes are not the outcome of a symposium. Instead, each editor has the potential to examine a chosen area with a broad perspective, both in subject matter as well as choice of chapter authors. The international perspective, especially with regard to public health initiatives, is emphasized where appropriate. The editors, whose training are both research and practice oriented, have the opportunity to develop a primary objective for their books, definite the scope and focus, and invite leading international authorities to be part of their initiative. The authors are encouraged to provide an overview of the field, discuss their own research, and relate their research findings to potential human health consequences.

Charged-Particle Reaction List 1948-1971 F McGowan,William T. Milner,1973 Charged-Particle Reaction List 1948-1971 is a guide to experiments on charged-particle-induced reactions that have been reported in journal literature during the period 1948 to June 1971. This compendium consists of the material from four Reaction Lists which have already appeared in Nuclear Data Tables. Each published article is listed under the target nuclei in the nuclear reactions which it treats. Reactions are denoted by A(a,b)B, where A and B are the target and residual nucleus, respectively; a is the bombarding charged particle and b is the outgoing product particle or particles. The guide also includes a brief information after the reaction designation, namely, the energy E of the bombarding projectile in MeV, a short statement of the type of data that is found in the paper, and a bibliographic information on the paper itself. A symbol THY in the extreme right-hand column denotes the theoretical papers concerned with analysis of nuclear reaction data. For papers dealing with experimental data on energy spectra, the angle of observation of the emerging reaction products, the accelerator, as well as the detector used are given for many entries under the column heading Quantity Measured. The guide will prove immensely useful for theoretical physicists, nuclear physicists, and molecular physicists.

Regulation, Market Prices, And Process Innovation Edward Greenberg,Christopher T. Hill,David J. Newburger,2019-07-16 Through the study of innovation in processes for the production of synthetic ammonia, the authors examine the effects of environmental and workplace regulations on business innovation in general. They present a history of ammonia production in the U.S., a survey of government regulation in the industry, and a model of process innovation that combines the economist's production function with the technical and practical concepts of the engineer. Contrary to the widely held view that regulation has an unfortunate impact on business, the authors demonstrate that—at least in one industry—the economic factors of production have a measurable impact on innovation, while regulation does not.
