Technology for a Quieter America National Academy of Engineering,Committee on Technology for a Quieter America,2010-10-30 Exposure to noise at home, at work, while traveling, and during leisure activities is a fact of life for all Americans. At times noise can be loud enough to damage hearing, and at lower levels it can disrupt normal living, affect sleep patterns, affect our ability to concentrate at work, interfere with outdoor recreational activities, and, in some cases, interfere with communications and even cause accidents. Clearly, exposure to excessive noise can affect our quality of life. As the population of the United States and, indeed, the world increases and developing countries become more industrialized, problems of noise are likely to become more pervasive and lower the quality of life for everyone. Efforts to manage noise exposures, to design quieter buildings, products, equipment, and transportation vehicles, and to provide a regulatory environment that facilitates adequate, cost-effective, sustainable noise controls require our immediate attention. *Technology for a Quieter America* looks at the most commonly identified sources of noise, how they are characterized, and efforts that have been made to reduce noise emissions and experiences. The book also reviews the standards and regulations that govern noise levels and the federal, state, and local agencies that regulate noise for the benefit, safety, and wellness of society at large. In addition, it presents the cost-benefit trade-offs between efforts to mitigate noise and the improvements they achieve, information sources available to the public on the dimensions of noise problems and their mitigation, and the need to educate professionals who can deal with these issues. Noise emissions are an issue in industry, in communities, in buildings, and during leisure activities. As such, *Technology for a Quieter America* will appeal to a wide range of stakeholders: the engineering community; the public; government at the federal, state, and local levels; private industry; labor unions; and nonprofit organizations. Implementation of the recommendations in *Technology for a Quieter America* will result in reduction of the noise levels to which Americans are exposed and will improve the ability of American industry to compete in world markets paying increasing attention to the noise emissions of products.

Occupational Noise Exposure Department of Health and Human Services,Centers for Disease Control and Prevention,National Institute Safety and Health,2014-02-19 In the Occupational Safety and Health Act of 1970, Congress declared that its purpose was to assure, so far as possible, safe and healthful working conditions for every working man and woman and to preserve our human resources. In this Act, the National Institute for Occupational Safety and Health (NIOSH) is charged with recommending occupational safety and health standards and describing exposure concentrations that are safe for various periods of employment-including but not limited to concentrations at which no worker will suffer diminished health, functional capacity, or life expectancy as a result of his or her work experience. By means of criteria documents, NIOSH communicates these recommended standards to regulatory agencies (including the Occupational Safety and Health Administration [OSHA]) and to others in the occupational safety and health community. Criteria documents provide the scientific basis for new occupational safety and health standards. These documents generally contain a critical review of the scientific and technical information available on the prevalence of hazards, the existence of safety and health risks, and the adequacy of control methods. In addition to transmitting these documents to the Department of Labor, NIOSH also distributes them to health professionals in academic institutions, industry, organized labor, public interest groups, and other government agencies. In 1972, NIOSH published *Criteria for a Recommended Standard: Occupational Exposure to Noise*, which provided the basis for a recommended standard to reduce the risk of developing permanent hearing loss as a result of occupational noise exposure [NIOSH 1972]. NIOSH has now evaluated the latest scientific information and has revised some of its previous recommendations. The 1998 recommendations go beyond attempting to conserve hearing by focusing on preventing occupational noise-induced hearing loss (NIHL). This criteria document reevaluates and reaffirms the recommended exposure limit (REL) for occupational noise exposure established by the National Institute for Occupational Safety and Health (NIOSH) in 1972. The REL is 85 decibels, A-weighted, as an 8-hr time-weighted average (85 dBA as an 8-hr TWA). Exposures at or above this level are hazardous. By incorporating the 4000-Hz audiometric frequency into the definition of hearing impairment in the risk assessment, NIOSH has found an 8% excess risk of developing occupational noise-induced hearing loss (NIHL) during a 40-year lifetime exposure at the 85-

dBA REL. NIOSH has also found that scientific evidence supports the use of a 3-dB exchange rate for the calculation of TWA exposures to noise. The recommendations in this document go beyond attempts to conserve hearing by focusing on prevention of occupational NIHL. For workers whose noise exposures equal or exceed 85 dBA, NIOSH recommends a hearing loss prevention program (HLPP) that includes exposure assessment, engineering and administrative controls, proper use of hearing protectors, audiometric evaluation, education and motivation, recordkeeping, and program audits and evaluations. Audiometric evaluation is an important component of an HLPP. To provide early identification of workers with increasing hearing loss, NIOSH has revised the criterion for significant threshold shift to an increase of 15 dB in the hearing threshold level (HTL) at 500, 1000, 2000, 3000, 4000, or 6000 Hz in either ear, as determined by two consecutive tests. To permit timely intervention and prevent further hearing losses in workers whose HTLs have increased because of occupational noise exposure, NIOSH no longer recommends age correction on individual audiograms.

Assessment of noise level at the Ondo State School of Health Technology Samuel Olufade,2018-01-12 Project Report from the year 2016 in the subject Physics - Acoustics, grade: 3.56, , language: English, abstract: This study was carried out in order to investigate the noise level at the Ondo State School of Health Technology, Akure. Prospective study design was adopted for this study and noise level meter was used to collect data and simple random sampling technique was used. The school was divided into 4 sections which are Academic, commercial, administrative, and residential sections and a sample size of 100 was determined, the retrieved questionnaire were sorted and analyzed using tables and bar charts. During the course of sampling with noise level meter, it was noted that noise coming from the commercial section was higher than any other section and ranged between 80dB and 89dB which is above the threshold limits man can be exposed to due to the operations carried out in the section. However, at night it was measured to be at lowest level of 49dB based on the close of commercial activities around 7pm daily. In the residential section it was noted that the level of noise produced between the hours of 10am and 1pm was the lowest but from the hour of 2pm upward the noise was at its peak based on the presence of the student in their various lodge ranging between 65dB to 79dB at the academic section the noise level range between 45dB to 60dB which means that the noise levels is low at the section. In the administrative section, the noise produced was between 45dB and 50dB which means that the noise level was at the lowest level for the entire school environment. In the questionnaire people's knowledge and perception was measured, sorted and analyzed which shows that noise level is high at the ondo state school of Health Technology which should be minimized to enhance a good and conducive environment for learning/teaching.

Sonic Thinking Bernd Herzogenrath,2017-02-23 Sonic Thinking attempts to extend the burgeoning field of media philosophy, which so far is defined by a strong focus on cinema, to the field of sound. The contributors urge readers to re-adjust their ideas of Sound Studies by attempting to think not only about sound [by external criteria, such as (cultural) meaning], but to think with and through sound. Series editor Bernd Herzogenrath's collection serves two interconnected purposes: in developing an alternative philosophy of music that takes music serious as a 'form of thinking'; and in bringing this approach into a fertile symbiosis with the concepts and practices of 'artistic research': art, philosophy, and science as heterogeneous, yet coequal forms of thinking and researching. Including contributions by both established figures and younger scholars working on cutting edge material, and weaving artistic responses and interventions in between the more theoretical texts, Herzogenrath's collection provides a lively introduction to a fresh debate.
