### *Space Fostering African Societies* Annette

Froehlich,2023-12-19 This peer-reviewed book provides detailed insights into how space and its applications are, and can be used to support the development of the full range and diversity of African societies, as encapsulated in the African Union's Agenda 2063. Following on from Part 1 to Part 4, which were highly acclaimed by the space community, it focuses on the role of space in supporting the UN Sustainable Development Goals in Africa, but covers an even more extensive array of relevant and timely topics addressing all facets of African development. It demonstrates that, while there have been significant achievements in recent years in terms of economic and social development, which have lifted many of Africa's people out of poverty, there is still a great deal that needs to be done to fulfill the basic needs of Africa's citizens and afford them the dignity they deserve. To this end, space is already being employed in diverse fields of human endeavor to serve Africa's goals for its future, but there is much room for further incorporation of space systems and data. Providing a comprehensive overview of the role space is playing in helping Africa achieve its developmental aspirations, the book will appeal to both students and professionals in fields such as space studies, international relations, governance, social, rural and technical development.

**Hollywood or History?** Paul J. Yoder,Aaron P. Johnson,2022-05-01 Traumagenic events—episodes that have caused or are likely to cause trauma—color the experiences of K-12 students and the social studies curriculum they encounter in U.S. schools. At the same time that the global COVID-19 pandemic has heightened educators’ awareness of collective trauma, the racial reckoning of 2020 has drawn important attention to historical and transgenerational trauma. At a time when social studies educators can simply no longer ignore “difficult” knowledge, instruction that acknowledges trauma in social studies classrooms is essential. Through employing relational pedagogies and foregrounding voices that are too often silenced, the lessons in *Hollywood or History? An Inquiry-Based Strategy for Using Film to Acknowledge Trauma in Social Studies* engage students in examining the role of traumatic or traumagenic events in social studies curriculum. The 20 *Hollywood or History?*

lessons are organized by themes such as political trauma and war and genocide. Each lesson presents film clips, instructional strategies, and primary and secondary sources targeted to the identified K-12 grade levels. As a collection, they provide ready-to-teach resources that are perfect for teachers who are committed to acknowledging trauma in their social studies instruction.

Silent Spill Thomas D. Beamish, 2002-02-01 In the Guadalupe Dunes, 170 miles north of Los Angeles and 250 miles south of San Francisco, an oil spill persisted unattended for 38 years. Over the period 1990-1996, the national press devoted 504 stories to the Exxon Valdez accident and a mere nine to the Guadalupe spill—even though the latter is most likely the nation's largest recorded oil spill. Although it was known to oil workers in the field where it originated, to visiting regulators, and to locals who frequented the beach, the Guadalupe spill became troubling only when those involved could no longer view the sight and smell of petroleum as normal. This book recounts how this change in perception finally took place after nearly four decades and what form the response took. Taking a sociological perspective, Thomas Beamish examines the organizational culture of the Unocal Corporation (whose oil fields produced the leakage), the interorganizational response of regulatory agencies, and local interpretations of the event. He applies notions of social organization, social stability, and social inertia to the kind of environmental degradation represented by the Guadalupe spill. More important, he uses the Guadalupe Dunes case as the basis for a broader study of environmental blind spots. He argues that many of our most pressing pollution problems go unacknowledged because they do not cause large-scale social disruption or dramatic visible destruction of the sort that triggers responses. Finally, he develops a model of social

accommodation that helps explain why human systems seem inclined to do nothing as trouble mounts.

*Artificial Intelligence Applications in Engineering*

**Current Trends in Connectionism** Lars F.

Niklasson, Mikael B. Bodin, 2013-07-04 In order to build intelligent machines, many researchers have turned to the only naturally occurring intelligent system: the brain. For quite a while now, both the function and architecture of the brain have served as inspiration to philosophers, psychologists, computer scientists, neurobiologists, physicists and others in their quest for solving problems that seem to require intelligence in their own particular domain. The progress in the field of connectionism -- or artificial neural networks -- has had its ups and downs during its maturing years. Advocates of the field pointed out the virtues of connectionist systems, dealing with low-level cognitive tasks such as visual recognition and pattern completion, and inherent properties such as generalization, fault tolerance and parallel processing. However, research in the field virtually came to a halt at the end of the 1960s when Minsky and Papert published their critical analysis of connectionist systems, Perceptrons. In the beginning of the 1980s, the field was reborn with the appearance of new powerful learning methods which overcame many of the computational problems identified by Minsky and Papert. This volume is characterized by a number of different research directions distinguished by their perspectives on systems comprising interconnected sets of simple processing elements. Scientists who have strong backgrounds in neurobiology concentrate on the issues involved when modelling natural systems. Researchers

with philosophical and psychological backgrounds stress other aspects which might not always be intuitively relevant to biology but instead are concerned with the mind and its higher-order cognitive capabilities. On the other hand, many researchers and engineers in industry take advantage of the wide applicability and mathematical properties of connectionist systems in order to solve practical problems, sacrificing even more of the principles underlying the basic idea of mimicking the function and architecture of the brain. None of these directions are right or wrong, but there has perhaps been too little exchange of knowledge and experience between them. The main purpose for organizing this conference was to bring together researchers with different backgrounds to exchange ideas and visions in the broad field of connectionism -- providing means for new insights that may push this area to another major breakthrough.

**Instrumentation and Measurement Technologies for Water Cycle Management** Anna Di Mauro, Andrea Scozzari, Francesco Soldovieri, 2022-11-23 This book aims at presenting a unified framework for the description of working principles, recent advances and applications of cutting-edge measurement technologies for the water sector. Instrumentation and measurement technologies are currently playing a key role in the monitoring, assessment and protection of environmental resources. Measurement techniques and sensing methods for the observation of water systems are rapidly evolving and are requiring an increased multi-disciplinary participation. The whole water sector is characterised by multiple technological contexts concerning the monitoring of the resource, given the broad coverage that includes water from its natural domains to the men-made infrastructures. In particular, instrumentation and measurement technologies have a

pervasive presence in all the necessary aspects for the assessment, monitoring and control of the water resource and of its relationship with the various environmental stressors, including the anthropic pressures. Therefore, the book aims at presenting how the diagnostics/monitoring methodologies and the related technologies can give an answer to the issues raised by the complex scenario characterising the water cycle management (WCM). The book is structured in five topical sections, grouped by similarity of their technological and/or applicative contexts.

**Mathematical Modelling and Numerical Simulation of Oil Pollution Problems** Matthias

Ehrhardt,2015-03-10 Written by outstanding experts in the fields of marine engineering, atmospheric physics and chemistry, fluid dynamics and applied mathematics, the contributions in this book cover a wide range of subjects, from pure mathematics to real-world applications in the oil spill engineering business. Offering a truly interdisciplinary approach, the authors present both mathematical models and state-of-the-art numerical methods for adequately solving the partial differential equations involved, as well as highly practical experiments involving actual cases of ocean oil pollution. It is indispensable that different disciplines of mathematics, like analysis and numerics, together with physics, biology, fluid dynamics, environmental engineering and marine science, join forces to solve today's oil pollution problems. The book will be of great interest to researchers and graduate

students in the environmental sciences, mathematics and physics, showing the broad range of techniques needed in order to solve these pollution problems; and to practitioners working in the oil spill pollution industry, offering them a professional reference resource.
