Limit States Design in Structural Steel Geoffrey L. Kulak, Gilbert Yves Grondin, 2016 The Tenth Edition of this text introduces the changes in the 2014 edition of CSA-S16 standard and the 2013 edition of CSA-G40.20/G40.21. Since this textbook is intended to be used in conjunction with the 11th edition of the CISC Handbook of steel construction, the changes in the Handbook have also been adopted in the textbook. These changes, which reflect changes in the steel industry, include adjustments to rolled steel shapes section properties to reflect a change in the flange to web transition radius, the deletion of some rolled shapes and welded wide flange (WWF) sections that are no longer produced in North American mills. With an expanding global market, some structural steel shapes, such as rolled wide flange sections, are becoming more prevalent in American steel grades (ASTM classification) whereas some shapes, such as plates, are still readily available in Canadian steel grades (CSA-G40.21 classification). Therefore American grade steels have been introduced in some of the design examples. Furthermore, since metric size bolts are only rarely used in the construction industry, the design tables for bolts and bolted connections presented in the CISC Handbook have abandoned metric size bolts. Therefore, imperial size bolts are mainly used in this new edition of the text. Divided into 11 chapters, the book covers tension members, flexural members, columns, beam-columns, stability, fatigue behaviour, connections, plate girders, composite construction, and types and grades of structural steel.

Architecturally Exposed Structural Steel Terri Meyer Boake, 2015-02-17 This book provides the means for a better control and purposeful consideration of the design of Architecturally Exposed Structural Steel (AESS). It deploys a detailed categorization of AESS and its uses according to design context, building typology and visual exposure. In a rare combination, this approach makes high quality benchmarks compatible with economies in terms of material use, fabrication methods, workforce and cost. Building with exposed steel has become more and more popular worldwide, also as advances in fire safety technology have permitted its use for building tasks under stringent fire regulations. On her background of long standing as a teacher in architectural steel design affiliated with many institutions, the author ranks among the world's best scholars on this topic. Among the fields covered by the extensive approach of this book are the characteristics of the various categories of AESS, the interrelatedness of design, fabrication and erection of the steel structures, issues of coating and protection (including corrosion and fire protection), special materials like weathering steel and stainless steel, the member choices and a connection design checklist. The description draws on many international examples from advanced contemporary architecture, all visited and photographed by the author, among which figure buildings like the Amgen Helix Bridge in Seattle, the Shard Observation Level in London, the New York Times Building and the Arganquela Footbridge.

Design of Steel Structures Elias G. Abu-Saba, 2012-12-06 This book is intended for classroom teaching in architectural and civil engineering at the graduate and undergraduate levels. Although it has been developed from lecture notes given in structural steel design, it can be useful to practicing engineers. Many of the examples presented in this book are drawn from the field of design of structures. Design of Steel Structures can be used for one or two semesters of three hours each on the undergraduate level. For a two-semester curriculum, Chapters 1 through 8 can be used during the first semester. Heavy emphasis should be placed on Chapters 1 through 5, giving the student a brief exposure to the consideration of wind and earthquakes in the design of buildings. With the new federal requirements vis a vis wind and earthquake hazards, it is beneficial to the student to have some understanding of the underlying concepts in this field. In addition to the class lectures, the instructor should require the student to submit a term project that includes the complete structural design of a multi-story building using standard design procedures as specified by AISC Specifications. Thus, the use of the AISC Steel Construction Manual is a must in teaching this course. In the second semester, Chapters 9 through 13 should be covered. At the undergraduate level, Chapters 11 through 13 should be used on a limited basis, leaving the student more time to concentrate on composite construction and built-up girders.
