Microbiota of Grapes: Positive and Negative Role on Wine Quality Giuseppe Spano,Sandra Torriani,2017-03-28 During spontaneous food/beverage fermentations, the microbiota associated with the raw material has a considerable importance: this microbial consortium evolves in reason of the nutrient content and of the physical, chemical, and biological determinants present in the food matrix, shaping fermentation dynamics with significant impacts on the ‘qualities’ of final productions. The selection from the indigenous micro-biodiversity of ‘virtuous’ ecotypes that coupled pro-technological and biotechnological aptitudes provide the basis for the formulation of ‘tailored’ starter cultures. In the fermenting food and beverage arena, the wine sector is generally characterized by the generation of a high added value. Together with a pronounced seasonality, this feature strongly contributes to the selection of a large group of starter cultures. In the last years, several studies contributed to describe the complexity of grapevine-associated microbiota

using both culture-dependent and culture-independent approaches. The grape-associated microbial communities continuously change during the wine-making process, with different dominances that correspond to the main biotechnological steps that take place in wine. In order to simplify, following a time trend, four major dominances can be mainly considered: non-Saccharomyces, Saccharomyces, lactic acid bacteria (LAB), and spoilage microbes. The first two dominances come in succession during the alcoholic fermentation: the impact of Saccharomyces (that are responsible of key enological step of ethanol production) can be complemented/integrated by the contributions of compatible non-Saccharomyces strains. Lactic acid bacteria constitute the malolactic consortium responsible of malolactic fermentation, a microbial bioconversion often desired in wine (especially in red wine production). Finally, the fourth dominance, the undesired microbiota, represents a panel of microorganisms that, coupling spoilage potential to the resistance to the harsh conditions typical of wine environment, can cause important economic losses. In each of these four dominances a complex microbial biodiversity has been described. The studies on the enological significance of the micro-biodiversity connected with each of the four dominances highlighted the presence of a dichotomy: in each consortia there are species/strains that, in reason of their metabolisms, are able to improve wine 'qualities' (resource of interest in starter cultures design), and species/strains that with their metabolism are responsible of depreciation of wine. Articles describing new oenological impacts of yeasts and bacteria belonging to the four main categories above mentioned (non-Saccharomyces, Saccharomycetes, lactic acid bacteria, and spoilage microbes) are welcome. Moreover, in this Research Topic, we encourage mini-review submissions on topics of immediate interest in wine microbiology that link microbial biodiversity with positive/negative effects in wine.

**Redress Schemes for Personal Injuries** Sonia Macleod, Christopher Hodges, 2017-11-30 This ground-breaking book takes a fresh look at potential non-litigation solutions to providing personal injury compensation. It is the first systematic comparative study of such a large number – over forty – of personal injury compensation schemes. It covers the drivers for their creation, the frameworks under which they operate, the criteria and thresholds used, the compensation offered, the claims process, statistics on throughput and costs, and analysis of financial costings. It also considers and compares the successes and failings of these schemes. Many different types of redress providers are studied. These include the comprehensive no-blame coverage offered by the New Zealand Accident Compensation Corporation; the widely used Patient, Pharmaceutical, Motor Accident and Workers Compensation Insurance systems of the Nordic states; the far smaller issue-focused schemes like the UK Thalidomide and vCJD Trusts; vaccine damage schemes that exist in many countries; as well as motor vehicle schemes from the USA. Conclusions are drawn about the functions, essential requirements, architecture, scope, operation and performance of personal injury compensation systems. The relationships between such schemes, the courts and regulators are also discussed, and both calls and need for reforms are noted. Noting the wide calls for reform of NHS medical negligence litigation within the UK, and its replacement with a no blame approach, the authors' findings outline options for future policy in this area. This major contribution builds on general shifts from courts to ADR, and from blame to no blame in regulation, and is a work that has the potential to have a major impact on the field of personal injury redress. With contributions by Raymond Byrne, Claire Bright, Shuna Mason, Magdalena Tulibacka, Matti Urho, Mary Walker and Herbert Woopen.
