Converting future cash flow streams into a present value allows future cash flows to be treated within the same time-frame and thereby provides the means necessary to evaluate an asset fairly. The book covers concepts such as weighted cost of capital, present and future value, interest rates, mortgages, annuities, growth models, discounting, internal rate of return and net present value assessments.

The Time Value of Life Tisa L. Silver, 2011-06-20 Life is treasured in minutes, hours, days, months, and years. In *The Time Value of Life*, author Tisa L. Silver shares how a simple decision-making rule used in finance can be applied to making decisions in other areas of life-especially how to wisely use the time you've been given on earth. A student-turned-professor of finance, Silver introduces the Time Value of Money (TVM) model. She uses hypothetical and real-life examples to show why time should be treated as a valuable gift and demonstrates the parallels between finance and life and between money and time. Silver advocates taking the following steps: Recognize time is a limited resource. Diversify investments. Respect time. Believe in your investments. Make collaborative investments. Understand good investments pay off. Realize the past doesn't dictate the future. Know that your future value depends on your inputs. *The Time Value of Life* communicates that time is more valuable than money because the value of your life depends on what you do with your time. Stop spending time; start investing it. By being careful about the way you invest your time now, you can enjoy the rewards later.

Advanced Capital Budgeting Harold Bierman, Jr., Seymour Smidt, 2014-02-04
 Written by authors of established texts in this area, this book is a companion volume to the classic *The Capital Budgeting Decision*. Exploring this key topic in corporate finance the authors examine the complexities of capital budgeting as well as the opportunities to improve the decision process where risk and time are important elements. Containing ‘Global Aspects’ sections that cover cross-border decision-making, this book also emphasizes the application of capital budgeting techniques to a variety of issues, including the hugely significant ‘buy versus lease’ decision that cost corporations billions each year. It gives in-depth coverage to: real options – the value of a project must take into consideration the flexibility that it provides management, acknowledging the option of making decisions in the future when more information is available decomposing cash flows – a project consists of many series of cash flows and each series deserves its own specific risk-adjusted discount rate. Decomposing the cash flows of an investment highlights the fact that while managers are generally aware that divisions and projects have different risks, too often they neglect the fact

that the cash flow components may also have different risks, with severe consequences on the quality of the decision-making. Designed to assist those making business decisions at all levels, this volume is essential reading for all those working in or studying capital budgeting.

Justifying Investment in Advanced Manufacturing Technology The Chartered Institute of Management Accountants the Institution of Production Engineers, 2013-11-21 Towards the end of 1983, the Advisory Council for Applied Research and Development (ACARD) published a report giving the findings of a working group which had been set up to study the factors which inhibited or supported the introduction of advanced manufacturing technology (AMT) in engineering manufacture. Prominent amongst their findings was that, up to that time, 'appraisal of investment in AMT on a short-term financial basis was not entirely adequate' and that 'the conventional approach to financial appraisal techniques, directed towards an early return on capital invested, may be inappropriate'. Today, over three years later, advanced manufacturing technology is more widely recognised and is providing a proven solution to survival and growth for manufacturers. However, many medium- and small-size companies are still finding great difficulty in the evaluation and justification of investment in this vital area. The Institution of Production Engineers therefore set up a special joint working party with The Chartered Institute of Management Accountants to follow up the ACARD report, with the objective of examining the whole area of the justification of investment in advanced manufacturing technology.

Hamid R. Parsaei, W.G. Sullivan, T.R. Hanley, 2013-10-22 Competence in investment analysis is now a basic requirement for most practicing managers, engineers, and financial analysts in order to avoid possible serious mistakes arising from flawed or inadequate knowledge of the discipline. Furthermore, individuals who make decisions based on technical economics stake their professional futures, in many cases, on the accuracy of such evaluations. The aim of this volume is to provide a balanced view of the essential components of economic and financial analysis including: 1. Strategic and design issues; 2. Principles of cost management systems and activity-based costing, and; 3. Tools for developing the financial measures of investment worth, with advanced topics and case studies in these three areas. This volume provides a refreshing insight into the various methods that engineers, managers, and financial analysts may need to consider to find good alternatives for the investment of scarce resources. Not only are new ventures presented, but also improvements within existing facilities that include process modification, product design, equipment replacement, and plant expansion/contraction.

The Time Value of Money Chris Smal, 1991

A 'Triple Bottom Line' Approach to Advanced Project Evaluation Grace Ding, Goran Runeson, 2020-03-06 The concept of 'the triple bottom line' has recently emerged to describe a new framework for development aimed at achieving economic and social balance while maintaining the long-term integrity of ecological systems. This requires measuring not only the economic viability of projects, but also their impact on the environment and

their contribution to society. We live in a world where most people are aware of the importance of our environment. The way in which this realisation came about has, in hindsight, not been as simple as could have been expected. Systematic evaluations of the economic viability of projects using discounting date back to the beginning of the last century and are something which has been readily accepted, especially over the last few decades. However, an integrated approach, including environmental and social aspects, is much more recent, and even now, the methods and methodologies for such an approach are still being developed. This volume details the state of the art of the development towards the triple bottom line. It indicates where there is still debate about fundamental principles, where theory has been overlooked in the name of convenience, and where there are still unresolved problems. The discussions provided here will serve to provide a more detailed understanding of what we do in our calculations, what they mean and the limitations thereof.
