*Discrete Choice Methods with Simulation* Kenneth Train, 2009-07-06 This book describes the new generation of discrete choice methods, focusing on the many advances that are made possible by simulation. Researchers use these statistical methods to examine the choices that consumers, households, firms, and other agents make. Each of the major models is covered: logit, generalized extreme value, or GEV (including nested and cross-nested logits), probit, and mixed logit, plus a variety of specifications that build on these basics. Simulation-assisted estimation procedures are investigated and compared, including maximum simulated likelihood, method of simulated moments, and method of simulated scores. Procedures for drawing from densities are described, including variance reduction techniques such as antithetics and Halton draws. Recent advances in Bayesian procedures are explored, including the use of the Metropolis-Hastings algorithm and its variant Gibbs sampling. The second edition adds chapters on endogeneity and expectation-maximization (EM) algorithms. No other book incorporates all these fields, which have arisen in the past 25 years. The procedures are applicable in many fields, including energy, transportation, environmental

studies, health, labor, and marketing.

**Simulation of the Railway Component of Intermodal Transportation** Timothy S. Meinert, 1998 In this report, the authors describe a detailed research model for the railway component of intermodal trucking operations, using discrete event system simulation. The research models developed herein focus on the effects of railhead location and mix on drayage efficiency relative to shipment density profiles provided by BSNF Railway in the Chicago, Illinois area. The research advances the state of the art in intermodal simulation modeling through concurrent consideration of multiple-terminal network design and terminal activities such as hustling and train building.
