Doubled Haploid Technology Jose M. Segui-Simarro,2021-07-17 This title offers 62 chapters divided among three volumes covering the latest topics dealing with Doubled Haploid (DH) technology, as well as methods to produce DHs in different species through different in vivo and in vitro approaches. Volume 2 discusses the latest hot topics in DH technology; protocols to produce DHs in four apiaceae, caraway, fennel, dill, and carrot; DH production in different brassicaceae including Brassica napus, Brassica rapa, and Brassica carinata; and techniques to produce DHs by different androgenesis-based methods in several members of the Solanaceae family such as eggplant, pepper, tobacco, and potato. Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, application details for both the expert and non-expert reader, and tips on troubleshooting and avoiding known pitfalls. Authoritative and comprehensive, Doubled Haploid Technology, Volume 2: Hot Topics, Apiaceae, Brassicaceae, Solanaceae is a valuable resource for scientists and researchers looking to learn more about this interesting and developing field.

Cyclostratigraphy and the Milankovitch Theory W. Schwarzacher,1993-08-24

Cyclostratigraphy is concerned primarily with measuring geological time and the time units used in this approach are sedimentary cycles. Milankovitch cycles mark time intervals of tens of thousands to several millions of years. Such cycles are the result of variations in the Earth's position in relation to the Sun and these in turn determine the climatic variations. The Milankovitch theory was resurrected in the 1960's when evidence from Pleistocene deep sea sediments linked orbital variations and climate. This monograph discusses sedimentary cycles and their use in measuring geologic time. There is considerable effort made to clarify the term sedimentary cycle, in particular, the two opposing concepts of cyclic stratification and event stratification. The recognition of sedimentary cycles and of Milankovitch cycles specifically, is considered and care is taken with the question of relating sediment thickness to time. Several examples from the Carboniferous to the Cretaceous are given to show how cyclostratigraphy can be applied to current geological problems. This volume should be of interest to geologists involved with stratigraphical analysis and basin analysis.

Marvell Poems Andrew Marvell,2004 He is known chiefly for his brilliant lyric poems, including The Garden, The Definition of Love, Bermudas, To His Coy Mistress, and the Horatian Ode to Cromwell. Marvell's work is marked by extraordinary variety, ranging from incomparable lyric explorations of the inner life to satiric poems on the famous men and important issues of his time-one of the most politically volatile epochs in England's history. From the lover's famous admonition, Had we but World enough, and Time, / This coyness, Lady, were no crime, to the image of the solitary poet Annihilating all that's made / To a green Thought in a green Shade, Marvell's poetry has earned a permanent place in the canon and in the hearts of poetry lovers.

Compaction of Argillaceous Sediments

Diagenesis, III G.V. Chilingarian, K.H. Wolf, 1992-05-19 The present volume is an intellectual agglomeration covering a variety of topics in diagenesis. It starts with the diagenesis of marine pore waters and soft-sediment deformations, followed by two chapters on sandstones - one on climatic influence in terrestrial sandstone diagenesis and the other on the deep-sea volcanoclastic sandstones. Diagenesis of carbonates is treated next, with one chapter on compactional diagenesis and another devoted to a case study (Aymestry Limestone Beds, UK). There are two chapters on the origin and migration of oil: (a) maturation of organic matter, and (b) relation of diagenesis to mineralization and hydrocarbon reservoir development, followed by a chapter on sedimentary ore genesis - banded iron-formation. In conclusion there are two chapters on paleosols. This book will be of interest to geologists, geochemists and petroleum engineers.

Sedimentation Models and Quantitative Stratigraphy W.

Schwarzacher, 1975-01-01 Sedimentation Models and Quantitative Stratigraphy

Clays, Muds, and Shales C.E. Weaver, 1989-11-10 This book provides a comprehensive and critical summary of clay mineral literature that relates to geology and geologic processes, making it useful both as a reference book for geologists and as a text for the specialist. The book encompasses the full scope of clay-shale geology. An introductory chapter provides basic background terminology and classification. This is followed by a relatively long chapter on the structure and composition of the various clay minerals. Chapter 3 provides an introduction to soil formation, chemical weathering, microbial alteration and the pedogenic formation of clay minerals. Chapters 4 and 5 cover the continental and marine transport, and deposition of clays. Both mechanisms and examples are presented, ranging from biodepositional to the nepheloid layer. Chapter 6 reviews data on the low to high temperature formation of clay minerals from marine volcanics, and the growth of authigenic clays in shallow marine, brackish, and evaporite environments. Chapter 7, Diagenesis Metamorphism, covers both burial diagenesis and the processes occurring during the conversion of shale to clay. Chapter 8 discusses the formation of authigenic-diagenetic formation of clays in sandstones. Chapter 9 describes the temporal distribution of clay minerals in North and South America, Europe, Africa and the Atlantic Ocean. The clay suites are related to factors such as continental drift, tectonics, climate and environment. The final brief chapter covers compaction, lithification and some general features of shales. The book is liberally sprinkled with x-ray patterns, chemical analyses, and SEM and TEM pictures, in addition to hundreds of examples.

Green Marine Clays G.S. Odin, 1988-11-01 Green Marine Clays provides a comparative study of four authigenic marine clays: the well-known glaucony marine facies; the newly-identified sedimentary facies - verdine; the old oolitic ironstone facies; and the celadonite-bearing facies. The book demonstrates that the sea bottom plays host to a variety of clay minerals specific to the marine environment: ferric di-trioctahedral "serpentine", ferric chlorite, ferric smectite, ferric mica, ferric "swelling chlorite", all widespread in present oceans and all fundamentally formed by crystal growth and recrystallization processes in semi-confined marine microenvironments. A unique feature of the book is the inclusion of the first detailed study of the verdine facies characterized by a variety of authigenic green clays, some of which are new clay mineral species widespread in all tropical oceans. The celadonite-bearing facies has been studied intensively in the last few years and new results are obtained from deep sea samples and

from land outcrops. The current knowledge is synthesized and reviewed in comparison with the glaucony facies. A new approach is adopted in the description of the old oolitic ironstone facies in which a comparison is made with the recent verdine facies. The material is abundantly illustrated throughout by 133 figures and 59 tables; 36 of the figures consist of plates showing 170 selected pictures obtained at different scales of observation including the field, binocular microscope, thin sections, transmission electron microscopy, scanning electron microscopy, high resolution transmission electron microscopy, X-ray diffraction. A subject index completes the book. The information presented here will help geologists construct a clearer picture of environmental and depositional history of rocks. It will appeal to sedimentologists interested in the processes by which, and the environment in which, clay minerals form. Clay mineralogists will find much useful information on a variety of iron rich minerals, and geochemists interested in the iron in the sea and those working with sedimentary iron ores will also benefit from the book.

Diagenesis George V. Chilingar, Karl H. Wolf, 1988

Clay Minerals B. Velde, 2000-04-01 This book follows another by the same author, published in 1977, which the author considered as "a first attempt to put some order in the house of clay petrology". That book was described as "an excellent first attack on clay mineral petrology... informative, and stimulating because of the method of presentation and the open-door treatment of the subject. Not only clay-mineral scientists but petrologists in general must read this first book on clay mineral petrology." (Earth Science Reviews). This book describes clay mineral occurrence in terms of the physical and chemical forces which influence it. It includes a geological description of mineral occurrence, a definition of the major features of clay mineral chemical composition, and an indication of the physical-chemical boundaries of these occurrences. It also presents general patterns for the geological environments of weathering, sedimentation, burial diagenesis, deep sea basalt alteration, hydrothermal alteration of acidic rocks and chemical precipitation in acidic and basic environments. The major clay groups are related to one another as they occur in geological systems through the use of graphical analysis. The author has thoroughly reviewed the relevant literature for the last 25 years. The data and analyses obtained and presented in this book will not only make interesting reading, but will also prove extremely useful to those involved with studies in deep sea research, mining geology, petroleum geology, agronomy and civil engineering.
