Mobile Agents for Telecommunication Applications Ahmed Karmouch, Thomas Magedanz, Jaime Delgado, 2003-06-30

Research in the telecommunications field suggests that future network infrastructures will be composed of sensors, wireless devices, personal digital assistants, networked appliances and numerous types of services. This brings up key issues such as unfamiliar users and service interfaces, discovering services that match user's needs, finding and tracking people and resources, establishing useful contacts and appropriate associations between resources and users, and managing a large number of dynamic network entities all of which must be performed in an automated and proactive manner with a certain degree of autonomy and mobility. These are the main characteristics exhibited by mobile software agent behavior, making the technology more suitable for future telecommunication applications and services. It also reveals the tremendous potential for the mobile agent paradigm. The potential complexity of mobile agent operation requires that mechanisms exist on several levels to coordinate its activities. For this purpose research and development on various forms of mobile agents continues to grow in a staggering fashion. Age-based applications and services such as network management, e-commerce, information gathering on the Internet, mobile communications, active networking, and most recently ad hoc communications are becoming increasingly popular and continue to contribute to the development and to the success of mobile agent technology. In addition it is well established that mobile agents is an ideal sister technology for mobile ad hoc networks where users, applications, services, devices and networks are mobile and dynamically configurable.

Highlighting a range of topics such as machine learning, computational linguistics, and semantic analysis, this multi-volume book is ideally designed for computer engineers, computer and software developers, IT professionals, academicians, researchers, and upper-level students seeking current research on the latest trends in the field of natural language processing.

Designing Autonomous Agents Pattie Maes, 1990 *Designing Autonomous Agents* provides a summary and overview of the radically different architectures that have been developed over the past few years for organizing robots. These architectures have led to major breakthroughs that promise to revolutionize the study of autonomous agents and perhaps artificial intelligence in general. The new architectures emphasize more direct coupling of sensing to action, distributedness and decentralization, dynamic interaction with the environment, and intrinsic mechanisms to cope with limited resources and incomplete knowledge. The research discussed here encompasses such important ideas as emergent functionality, task-level decomposition, and reasoning methods such as analogical representations and visual operations that make the task of perception more realistic. Contents A Biological Perspective on Autonomous Agent Design, Randall D. Beer, Hillel J. Chiel, Leon S. Sterling * Elephants Don't Play Chess, Rodney A. Brooks * What Are Plans For? Philip E. Consequentialism Christian Seidel,2018-11-15 Consequentialism is a focal point of discussion and a driving force behind important developments in moral philosophy. Recently, the debate has shifted in focus and in style. By seeking to consequentialize rival moral theories, in particular those with agent-relative characteristics, and by framing accounts in terms of reasons rather than in terms of value, an emerging new wave consequentialism has presented - at much higher levels of abstraction - theories which proved extremely flexible and powerful in meeting long-standing and influential objections. This volume of new essays on new wave consequentialism initiates and stimulates novel lines of discussions among proponents and their critics. The contributions explore new directions in new wave consequentialism and present refined conceptual frameworks (in Part I), raise challenging fundamental problems for these frameworks and the new wave's theoretical basis (in Part II), and give a balanced assessment of the new wave's limits and achievements in specific contexts of commonsense moral practice (in Part III). The volume will be of interest to all readers in ethical and moral theory.

Fame Games Graeme Turner,Frances Bonner,P. David Marshall,2000-10-12 The areas of publicity, public relations and promotions have been considered to be on the periphery of the media. Yet this revealing new book demonstrates that they form a fundamental component of the media industries, with the decline of hard news being accompanied by the rise of gossip and celebrity. In addition to making a substantial contribution to our understanding of the cultural function of celebrity, Fame Games outlines how the promotion industry has developed and how celebrity is produced, promoted, and traded within the Australian media. While their analysis will inform academic debates on media practice internationally, the authors have taken the unique step of investigating the workings of the Australian promotion industry from within. Interviews with over 20 publicists, promoters, agents, managers, and magazine editors have provided a wealth of information about the processes through which celebrity in Australia is produced.

Innovative Internet Computing Systems Thomas Böhme,Herwig Unger,2003-05-15 Nowadays, the Internet is the most commonly used medium for the exchange of data in different forms. Presently, over 60 million machines have access to the Internet and to its resources. However, the Internet is also the largest distributed system offering different computational services and possibilities not only for cluster computing. If the needs of modern mobile computing and multimedia systems are taken into account, it becomes clear that modern methods must ensure an effective development and management of the Internet allowing each user fast access to this huge resource space. The Innovative Internet Computing Systems workshop is organized by the Gesellschaft für Informatik (GI) in Germany. It intends to be an open meeting point for scientists dealing with different aspects of this complex topic. In contrast to the Distributed Communities on the Web workshops, which can be considered as the roots of

I CS, special attention is given to fundamental - search works and the application of theoretical and formal results in practical implementations.
