Redistricting and Representation Thomas Brunell,2010-04-02 Pundits have observed that if so many incumbents are returned to Congress to each election by such wide margins, perhaps we should look for ways to increase competitiveness – a centerpiece to the American way of life – through redistricting. Do competitive elections increase voter satisfaction? How does voting for a losing candidate affect voters' attitudes toward government? The not-so-surprising conclusion is that losing voters are less satisfied with Congress and their Representative, but the implications for the way in which we draw congressional and state legislative districts are less straightforward. Redistricting and Representation argues that competition in general elections is not the sine qua non of healthy democracy, and that it in fact contributes to the low levels of approval of Congress and its members. Brunell makes the case for a radical departure from traditional approaches to redistricting – arguing that we need to pack districts with as many like-minded partisans as possible, maximizing the number of winning voters, not losers.

Consequences of Maritime Critical Infrastructure Accidents Magdalena Bogalecka,2019-11-01 *Consequences of Maritime Critical Infrastructures Accidents* presents a probabilistic general model of critical infrastructure accident consequences. This include three models of the process of the events generated by a critical infrastructure accident, the process of the environment threats and the process of environment degradation. This is all created and adopted to the maritime transport critical infrastructure, with a focus on shipping networks applied to accident consequences modeling. *Consequences of Maritime Critical Infrastructures Accidents* is devoted to the assessment methods of consequences of environmental damages, with application to ship accidents. It is a new approach that has never been proposed and applied before and includes methods of modeling, identification, prediction and optimization to allow the reader to better understand the effects of these accidents on our oceans. Moreover, the general procedures and the new strategy presented in the book aim to lower environment losses concerned with chemical releases caused by an accident of ship critical infrastructure network operating within the Baltic Sea or world sea waters. Provides a complete approach to accident consequences modeling, identification, prediction and optimization Presents the theoretical background, which can be applied practically to maritime critical infrastructure accident consequences analysis Includes a general model for critical infrastructure accident consequences which is globally applicable and with wide applications in various industrial sectors
