**The Analysis of Directional Time Series: Applications to Wind Speed and Direction** Jens Breckling,2012-12-06 Given a series of wind speeds and directions from the port of Fremantle the aim of this monograph is to detect general weather patterns and seasonal characteristics. To separate the daily land and sea breeze cycle and other short-term disturbances from the general wind, the series is divided into a daily and a longer term, synoptic component. The latter is related to the atmospheric pressure field, while the former is studied in order i) to isolate particular short-term events such as calms, storms and oscillating winds, and ii) to determine the land and sea breeze cycle which dominates the weather pattern for most of the year. All these patterns are described in detail and are related to the synoptic component of the data. Two time series models for directional data and a new measure of angular association are introduced to provide the basis for certain parts of the analysis.

How to Make a Wind Speed Meter Barbara Alpert,2019 You can feel the air rush against you on a windy day. How can you measure the wind's speed? This book shows you how to make your own wind speed meter.

Using simple materials and easy step-by-step instructions, young readers can explore weather science through this fun project.--Publisher's description.

**Variation of the Drag Coefficient with Wind and Wave State** Beverly J. Byars,1985 The dissipation method is used to obtain estimates for the friction velocity  $U_{sub}^*$ , as well as values for the neutral drag coefficient,  $CDN$ , for data collected from a coastal tower off San Diego, California.  $C_{sub} DN$  is found to be independent of the ten-meter height windspeed,  $U_{sub} 10$ , for velocities between 4-9 m/sec. Its value is estimated to be  $(0.94 + or - 0.4)1000$  which compares well with values by Smith (1980) and Large and Pond (1981). Definite trends in  $C_{sub} DN$  with fetch and sea state are also observed. Drag coefficient estimates are found to be higher for short fetch than for long fetch conditions.  $C_{sub} DN$  is also seen to increase sharply just before frontal passages and during sea breeze conditions when the waves are actively growing. With the windspeed and wave field reaching equilibrium,  $C_{sub} DN$  is found to decrease with time to a smaller and more constant value. (Author).

**Mixing Heights, Wind Speeds, and Potential for Urban Air Pollution Throughout the Contiguous United States** George C. Holzworth,1972 The mixing-layer height and the average wind speed within the mixing layer were calculated twice for each day of a 5-year record of upper air observations at 62 National Weather Service stations int he contiguous United States. The times of day of these calculations are morning and mid-afternoon. A rough allowance was made for effects of the urban heat island on the morning mixing heights. The morning and afternoon times coincide approximately with those of maximum and secondary minimum concentrations of slow-reacting pollutants in cities. These calculations illustrate the typical large diurnal variation in atmospheric dispersion. Twenty charts present seasonal and annual, and morning and afternoon mean mixing heights and wind speeds. A model of some general dispersion features over urban areas is described in which the normalized pollutant concentration averaged over a city is a function of mixing height, wind speed, and city size (distance the wind travels across the city). Frequency values of mixing height by wind speed are used with the model to calculate average normalized concentration frequencies for each weather station. Thirty charts present isopleth analyses of seasonal and annual, and morning and afternoon normalized pollutant concentrations that were exceeded 10, 25, and 50 percent of the time for specified city sizes. The occurrence of episodes during which upper limits on mixing height and wind speed were not exceeded were determined from the daily morning and afternoon values of these parameters. Isopleths of the total number of episode-days for episodes lasting at least 2 days and at least 5 days with various limiting mixing-height and wind-speed values are presented in 20 charts.

**Forecasting of the wind speed under uncertainty** Muhammad Aslam, In this paper, the semi-average method under neutrosophic statistics is introduced. The trend regression line for the semi-average method is given in the presence of Neutrosophy in the data. The application of the semi-average method under indeterminacy is given with the help of wind speed data. The efficiency of the semi-average method under the neutrosophic statistics is discussed over the semi-average method under classical statistics. From the analysis, it is concluded that the proposed method is effective, informative, and flexible for the forecasting of wind speed.

**Testing average wind speed using sampling plan for Weibull distribution under indeterminacy** Muhammad Aslam, The time truncated plan for the Weibull distribution under the indeterminacy is presented. The plan parameters of the proposed plan are determined by fixing the indeterminacy parameter. The plan parameters are given for various values of indeterminacy parameters. From the results, it can be concluded that the values of sample size reduce as indeterminacy values increase. The application of the proposed plan is given using wind speed data. From the wind speed example, it is concluded that the proposed plan is helpful to test the average wind speed at smaller values of sample size as compared to existing sampling plan.

**Extreme Wind Speeds, Gustiness, and Variations with Height for MIL-STD 210B** Norman Sissenwine,1973 MIL-STD-210A, 'Climatic Extremes for Military Equipment', is being revised. The revision will include two sets of windspeed design goals for military equipment being developed for worldwide usage over land: (1) the speed up to which 'operations' are expected to proceed, (2) the speed that equipment should 'withstand' without irreversible damage. A study of gustiness and variations of wind with height during strong wind regimes is presented. Nomograms of gust factor versus gust duration and steady windspeed are used to assign the most dynamically effective gust according to equipment dimensions. Based on a power-law relationship, factors for adjusting windspeed to a common height to describe windspeed and gusts over the vertical extent of military equipment usage are presented. Also included is a tabulation of wind statistics for selected stations considered in the search for worldwide wind extremes.
