Narrativity in Cognition Brook Miller,2023-11-25 This book offers a novel theory of the roles narrative plays in cognition by arguing that we can develop rich interdisciplinary research by thinking of narrative as a form of processing. Narrative processing describes a mode of anticipating, organizing, and simulating experience that is provisional, ongoing, and deeply integrated into how we make sense of what happens and how we figure ourselves into it. Accounts of narrative differ widely between cognitive psychology, contemporary philosophy, and literary studies. As a result, it is difficult to reconcile research about narrative from these disciplines. Yet the questions at stake in this research are often profound. For example, how are experiences organized into meaningful sequences? How do

the rich and complex features of a ‘life narrative’ emerge from the ways experience is processed in perception, working memory, and other components of present cognition? The model of narrative processing proposed in this book complements several influential, emerging theories of cognition, including predictive processing, emotion as a component to cognition, and ecological theories of cognition. The book argues that the role of narrative in higher-order cognition is reciprocally related to the emergent narrative features of lower-order cognition. In doing so, it provides a coherent concept of narrative with the potential to inform research in various disciplines.

Current Controversies in Philosophy of Cognitive Science Adam J. Lerner, Simon Cullen, Sarah-

Jane Leslie, 2020-04-28 Cognitive science is the study of minds and mental processes. Psychology, neuroscience, computer science, and philosophy, among other subdisciplines, contribute to this study.

In this volume, leading researchers debate five core questions in the philosophy of cognitive science: Is an innate Universal Grammar required to explain our linguistic capacities? Are concepts innate or learned? What role do our bodies play in cognition? Can neuroscience help us understand the mind? Can cognitive science help us understand human morality? For each topic, the volume provides two essays, each advocating for an opposing approach. The editors provide study questions and suggested readings for each topic, helping to make the volume accessible to readers who are new to the debates.

Mental Models across Languages Pawel Sickinger,2018-12-15 This book presents a study that triangulates the meanings of expressions across English, German and Japanese via their perception-based conceptual representations. In an online experiment, native speakers of the three languages

were asked to design visual representations of expressions referring to baldness phenomena. These sets of visualizations are used to determine conceptual overlap or distance between expressions in the three languages, resulting in lexical-conceptual 'maps' for MALE BALDNESS. The study is discussed against the background of an embodied, perceptual symbol-based understanding of linguistic meaning. A section of the book further applies this perspective to the issue of translation, developing a process model of translation based on the concept of cognitive equivalence. The book presents a novel approach to lexical semantics from a cognitive linguistic perspective, tested through a methodologically innovative experiment. It is a compelling read to scholars in cognitive semantics, contrastive semantics, embodied cognition and cognitive translation studies.

Film/Video-Based Therapy and Trauma Joshua L. Cohen, 2022-12-30 This book uses film/video-based therapy to help build resilience in facing personal, communal, national, and global trauma triggers. Offering a rich and diverse range of perspectives on trauma, this volume advocates positive social change using therapeutic techniques in filmmaking as well as film/video-based therapy, in

conjunction with expressive art therapies such as drama, dance, music, painting, drawing, and more. Chapter authors address issues in one's home, community, country, and the world using integrative medicine and advocacy using film/video-based therapy and digital storytelling. The book highlights psychological trauma and how one can cope with the overwhelming triggers in today's world. It represents an articulate and comprehensive analysis of the ways in which traumatic human experience impacts, and is modified by, film and video media. Representing a rich and diverse range of perspectives on trauma through the lens of a camera, the authors document important examples of moments in which artistic expression becomes human resilience. Demonstrating how the language of film can facilitate watching, processing, and discussing images of trauma in therapy, in the home, in the community, and in the world, this volume will be of interest to educators and mental health practitioners with an interest in advancing psychotherapy and counseling techniques.

The Freedom of Words Anna M. Borghi, 2023-07-31 An exploration of how language shapes our mental and social lives, with a focus on abstract language and thought.

The Origin of Ideas Mark Turner, 2014-01-02 What makes human beings so innovative, so adept at rapid, creative thinking? Where do new ideas come from, and once we have them, how can we carry them mentally into new situations? What allows our thinking to range easily over time, space, causation, and agency-so easily that we take this truly remarkable ability for granted? In *The Origin of Ideas*, Mark Turner offers a provocative new theory to answer these and many other questions. While other species do what we cannot-fly, run amazingly fast, see in the dark-only human beings can innovate so rapidly and widely. Turner argues that this distinctively human spark was an evolutionary advance that developed from a particular kind of mental operation, which he calls blending: our ability to take two or more ideas and create a new idea in the blend. Turner begins by looking at the lionman, a 32,000-year-old ivory figurine, one of the earliest examples of blending. Here, the concepts lion and man are merged into a new figure, the lionman. Turner argues that at some stage during the Paleolithic Age, humans reached a tipping point. Before that, we were a bunch of large, unimaginative mammals. After that, we were poised to take over the world. Once biological evolution hit upon making

brains that could do advanced blending, we possessed the capacity to invent and maintain culture. Cultural innovation could then progress by leaps and bounds over biological evolution itself, leading to the highest forms of human cognition and creativity. For anyone interested in how and why our minds work the way they do, *The Origin of Ideas* offers a wealth of original insights-and is itself a brilliant example of the innovative thinking it describes.

The Oxford Handbook of 4E Cognition Albert Newen, Leon De Bruin, Shaun Gallagher, 2018-08-30
4E cognition (embodied, embedded, enactive, and extended) is a relatively young and thriving field of interdisciplinary research. It assumes that cognition is shaped and structured by dynamic interactions between the brain, body, and both the physical and social environments. With essays from leading scholars and researchers, *The Oxford Handbook of 4E Cognition* investigates this recent paradigm. It addresses the central issues of embodied cognition by focusing on recent trends, such as Bayesian inference and predictive coding, and presenting new insights, such as the development of false belief understanding. *The Oxford Handbook of 4E Cognition* also introduces new theoretical paradigms for

understanding emotion and conceptualizing the interactions between cognition, language, and culture. With an entire section dedicated to the application of 4E cognition in disciplines such as psychiatry and robotics, and critical notes aimed at stimulating discussion, this Oxford handbook is the definitive guide to 4E cognition. Aimed at neuroscientists, psychologists, psychiatrists, and philosophers, The Oxford Handbook of 4E Cognition will be essential reading for anyone with an interest in this young and thriving field.

From Electrons to Elephants and Elections Shyam Wuppuluri, Ian Stewart, 2022-04-08 This highly interdisciplinary book, covering more than six fields, from philosophy and sciences all the way up to the humanities and with contributions from eminent authors, addresses the interplay between content and context, reductionism and holism and their meeting point: the notion of emergence. Much of today's science is reductionist (bottom-up); in other words, behaviour on one level is explained by reducing it to components on a lower level. Chemistry is reduced to atoms, ecosystems are explained in terms of DNA and proteins, etc. This approach fails quickly since we can't extrapolate to the

properties of atoms solely from Schrödinger's equation, nor figure out protein folding from an amino acid sequence or obtain the phenotype of an organism from its genotype. An alternative approach to this is holism (top-down). Consider an ecosystem or an organism as a whole: seek patterns on the same scale. Model a galaxy not as 400 billion-point masses (stars) but as an object in its own right with its own properties (spiral, elliptic). Or a hurricane as a structured form of moist air and water vapour. Reductionism is largely about content, whereas holistic models are more attuned to context. Reductionism (content) and holism (context) are not opposing philosophies — in fact, they work best in tandem. Join us on a journey to understand the multifaceted dialectic concerning this duo and how they shape the foundations of sciences and humanities, our thoughts and, the very nature of reality itself.

Beyond Meaning Elly Ifantidou, Louis de Saussure, Tim Wharton, 2021-11-15 Despite the fact that they are often crucial to our understanding, the vague, ineffable elements of language use and communication have received much less attention from linguists than the more concrete, effable ones.

This has left a range of important questions unanswered. How might we account for the communication of non-propositional phenomena such as moods, emotions and impressions? What type of cognitive response do these phenomena trigger, if not conceptual or propositional? Do creative metaphors and unknown words in second languages and other ‘pointers’ to ‘conceptual regions’ communicate concepts learned from language alone? How might the descriptive ineffability of interjections, free indirect speech etc. be accommodated within a theory of communication? What of those working on the aesthetics of artworks, music and literature? What can evolution tell us about ineffability? The papers in this volume address these fascinating questions head-on. They represent a range of different attempts to answer them and, in so doing, allow us to pose exciting new questions. The aim, to bring the ineffable firmly within the grasp of theoretical pragmatics.

Heterogeneity of Function in Numerical Cognition Avishai Henik,Wim Fias,2018-05-17

Heterogeneity of Function in Numerical Cognition presents the latest updates on ongoing research and discussions regarding numerical cognition. With great individual differences in the development or function of numerical cognition at neuroanatomical, neuropsychological, behavioral, and interactional levels, these issues are important for the achievement of a comprehensive understanding of numerical

cognition, hence its brain basis, development, breakdown in brain-injured individuals, and failures to master mathematical skills. These functions are essential for the proper development of numerical cognition. Provides an innovative reference on the emerging field of numerical cognition and the branches that converge on this diverse cognitive domain Includes an overview of the multiple disciplines that comprise numerical cognition Focuses on factors that influence numerical cognition, such as language, executive attention, memory and spatial processing Features an innovative organization with each section providing a general overview, developmental research, and evidence from neurocognitive studies

When Maps Become the World Rasmus Grønfeldt Winther, 2020-06-29 Map making and, ultimately, map thinking is ubiquitous across literature, cosmology, mathematics, psychology, and genetics. We partition, summarize, organize, and clarify our world via spatialized representations. Our maps and, more generally, our representations seduce and persuade; they build and destroy. They are the ultimate record of empires and of our evolving comprehension of our world. This book is about the

promises and perils of map thinking. Maps are purpose-driven abstractions, discarding detail to highlight only particular features of a territory. By preserving certain features at the expense of others, they can be used to reinforce a privileged position. When *Maps Become the World* shows us how the scientific theories, models, and concepts we use to intervene in the world function as maps, and explores the consequences of this, both good and bad. We increasingly understand the world around us in terms of models, to the extent that we often take the models for reality. Winther explains how in time, our historical representations in science, in cartography, and in our stories about ourselves replace individual memories and become dominant social narratives—they become reality, and they can remake the world.
