William C. Morchin

Satellite Weather Radar William Bernard Goggins, 1974 The problem of making radar measurements of meteorological phenomena such as rainfall, clouds, and ice crystal formation from a satellite is discussed. The main problem areas are obtaining sufficient signal-to-noise ratio within the weight limitation of the satellite system and avoiding ground clutter when scanning any significant angle off nadir. Sufficient signal-to-noise ratio to detect heavy rainfall at 35 GHz is available for a downlooking only system within the weight power limitation of the Military Meteorological Satellites. An arrested aperture doppler system to reject ground clutter at large scan angles off nadir while detecting rainfall by doppler due to its vertical motion is suggested.

The Terminal Doppler Weather Radar (TDWR) Moving Target Simulator (MTS) at Orlando, Florida William H. Drury, John M. Frankovich, Lincoln Laboratory, 1992

Direct and Inverse Methods in Radar Polarimetry W.M Boerner, Leonard A. Cram, William A. Holm, David E. Stein, Werner Wiesbeck, Wolfgang Keydel, Dino Giuli, Dag T. Gjessing, Frédéric A. Molinet, Hans Brand, 2013-11-09 This foreword deals exclusively with the planning, organization, and execution of the Workshop's scientific as well as cultural programs. It is opened with a synopsis on how the global political changes that occurred immediately after the Workshop caused the delay in producing the proceedings, followed by a brief exposition on need, timeliness, and importance of this second ARW in the field of electromagnetic imaging, radar remote sensing, and target versus clutter discrimination; and an outline of the objectives. An informal discussion about some of the organizational details, a retrospective summary of events, and a preview of the third workshop, planned for 1993 September 19-25, is intended to recapture the spirit of this second NATO Advanced Research Workshop (1988 September 18-24), and will reveal how successful it was in comparison to the first of 1983 September 18-24, how its accomplishments may be appreciated and why a third and last workshop was requested by its participants to take place during 1993 September 19-25.

Target Scattering Mechanism in Polarimetric Synthetic Aperture Radar Si-Wei Chen, Xue-Song Wang, Shun-Ping Xiao, Motoyuki Sato, 2018-04-21 This book presents new and advanced concepts, theories and methodologies in polarimetric synthetic aperture radar (PolSAR) target scattering mechanism modeling and interpretation, which is dedicated to bridge the gap between the acquired data and practical applications. It proposes adaptive and generalized polarimetric target decompositions, to precisely interpret the target scattering mechanisms. Further, it develops a uniform polarimetric matrix rotation theory and a polarimetric coherence pattern visualization and

interpretation tool to completely explore and characterize the deep information and target signatures in the rotation domain. Finally, it demonstrates land cover classification, target detection, natural disaster damage investigation and mapping applications which use the novel scattering mechanism investigation tools. The book is a valuable resource for senior undergraduate and postgraduate students, teachers, engineers and researchers in the field of microwave remote sensing, radar polarimetry, imaging radar, and environmental studies.

Radar Meteorology Homer Wendell Hiser, William L. Freseman, 1959

Radar Engineer's Sourcebook William C. Morchin, 1993 A distillation of technical material culled from key radar publications and conferences that have occurred over the past five years, this book provides access to the answers to common design problems with designer crib sheets. William Morchin has also written *Airborne Early Warning Radar*.

Processing for Maximum Signal-to-clutter in AMTI Radars William Bernard Goggins, 1974 Phased array antennas and doppler signal processors designed to complement each other have been successfully used to maximize the signal-to-clutter (S/C) performance of AMTI radars. The optimum receiving antennas described in this paper allow for nonuniformities created in the ground-clutter doppler spectrum by the transmitting antenna and processing of the received doppler signal; the optimum signal-to-clutter digital processors allow for clutter spectra shaped by the combined effects of the transmitting-receiving antennas. The emphasis has been placed on producing antenna-processor designs that have complementary pass and reject bands. The mathematical techniques used in these designs maximize the ratio between the target signal and the clutter-plus-noise, expressed as a ratio of quadratic forms. The solution for the optimum design, which depends principally on the inversion of a single matrix rather than on any recursive technique, is obtained in closed form.

Meteorological Applications of the FM Doppler Radar R. G. Strauch, William Carroll Campbell, Russell B. Chadwick, K. P. Moran, 1975 Microwave FM-CW radars have been used for about 5 years to monitor the structure of atmospheric regions with large refractive-index fluctuations. We have recently devised a scheme that retrieves the Doppler velocity spectrum for each range resolution cell measured by an FM radar. In this paper we report initial results of meteorological measurements with this new capability and discuss its potential in remote sensing of the boundary layer.

Radar Meteorology Frédéric Fabry, 2015-05-21 This practical textbook introduces the fundamental physics behind radar measurements, to guide students and practitioners in the proper interpretation of radar reflectivity, Doppler velocity and dual-polarization imagery. Operational applications are explored, such as how radar imagery can be used to analyze and forecast convective and widespread weather systems. The book concludes with an overview of current research topics, including the study of clouds and precipitation using radars, signal processing, and data assimilation. Numerous full-color illustrations are included, as well as problem sets, case studies, and a variety of supplementary electronic material including animated time sequences of images to help convey complex concepts. This book is a valuable resource for advanced undergraduate and graduate students in radar meteorology and other related courses, such as precipitation microphysics and dynamics. It will also make a useful reference for researchers, professional meteorologists and hydrologists.

A Multi-level Radar Storm Contour Mapper William E. Lamkin, David Atlas, 1965

Airborne Early Warning Radar William C. Morchin, 1990 The first chapters introduce the subject and define the nature of the targets that radar is expected to detect and track and the natural environment--the atmosphere and clutter with which radar must deal. Subsequent chapters are devoted to the analysis and design formulation of airborne early warning radars. Emphasis is on information appropriate to radar bands that are conventionally used or

considered for long-range surveillance. Annotation copyrighted by Book News, Inc., Portland, OR

Basic Radar Analysis, Second Edition Mervin C. Budge, Shawn R. German, 2020-04-30 This highly-anticipated second edition of an Artech House classic covers several key radar analysis areas: the radar range equation, detection theory, ambiguity functions, waveforms, antennas, active arrays, receivers and signal processors, CFAR and chaff analysis. Readers will be able to predict the detection performance of a radar system using the radar range equation, its various parameters, matched filter theory, and Swerling target models. The performance of various signal processors, single pulse, pulsed Doppler, LFM, NLFM, and BPSK, are discussed, taking into account factors including MTI processing, integration gain, weighting loss and straddling loss. The details of radar analysis are covered from a mathematical perspective, with in-depth breakdowns of radar performance in the presence of clutter. Readers will be able to determine the noise temperature of a multi-channel receiver as it is used in active arrays. With the addition of three new chapters on moving target detectors, inverse synthetic aperture radar (ISAR) and constant false alarm rate (CFAR) and new MATLAB codes, this expanded second edition will appeal to the novice as well as the experienced practitioner.

A Low Profile Antenna for Airborne Station Keeping Radar Applications

Robert J. Mailloux, William G. Mavroides, 1971 The report describes the array of eight channel guide antennas designed to replace the directional antenna for the AN/APN-169 Aircraft Station Keeping System. Design data are given for the individual channel guide elements. The report includes the results of an extensive experimental program undertaken to evaluate the radiation properties of the elements alone, or in the array. (Author).

Tracking the History of Radar Oskar Blumtritt, Hartmut Petzold, William Aspray, 1994

An Airborne Radar Technique for Moving-target Detection, Location, and Tracking John K. Schindler, 1973 A novel technique for detecting, locating, and tracking moving targets from an airborne radar platform is described and analyzed. The technique uses the generally dissimilar linear doppler frequency modulated signals from moving targets and stationary ground clutter. A matched filter processor is defined and its resolution and ambiguity properties studied as function processor parameters. Sub-clutter visibility of the processor is then determined. Two techniques for digitally implementing the processor are discussed and the computational efficiencies briefly analyzed. Finally, target angular position can be determined using phase monopulse. It is then shown that target velocity--both ground speed and target heading--can be determined from radar observables. (Author).

Radar Meteorology Robert M. Rauber, Stephen L. Nesbitt, 2018-03-19 A comprehensive introduction to the current technology and application of radar in meteorology and atmospheric sciences Written by leading experts in the field, *Radar Meteorology, A first Course* offers an introduction to meteorological radar systems and applications, with emphasis on observation and interpretation of physical processes in clouds and weather systems. This comprehensive introduction to the subject offers an overview of the quantities essential to radar meteorology including the radar reflectivity factor, and Doppler, dual-polarization, and multi-wavelength radar variables. The authors highlight wind retrieval from single and multiple Doppler radars, precipitation estimation and hydrometeorological applications, with chapters dedicated to interpretation of radar data from warm season mid-latitude severe weather, winter storms, tropical cyclones and more. In addition, *Radar Meteorology* highlights research applications of this burgeoning technology, exploring dynamic applications such as space-borne and ground-based vertically pointing radar systems, and cloud, airborne and mobile radars. As meteorological radars are increasingly used professionally for weather observation, forecasting and warning, this much-needed text: - Presents an

introduction to the technical aspects and current application of radar as used in the meteorology and atmospheric sciences - Contains full-colour illustrations that enhance the understanding of the material presented - Examines the wide-range of meteorological applications of radar - Includes problems at the end of each chapter as a helpful review of the contents - Provides full instructor support with all illustrations and answers to problems available via the book's instructor website. Radar Meteorology offers a much-needed introductory text to the study of radar as applied to meteorology. The text was designed for a one semester course based on the authors' own course in Radar Meteorology at the University of Illinois at Urbana-Champaign.
