Gender and Distance Education Anu Aneja,2018-08-06 This book investigates the intersection of gender and distance education from a feminist perspective and explores their contemporary innovative interfaces in Indian and international contexts. The key issues raised here include a re- investigation of the democratizing potential of distance education from a gendered perspective (especially in developing countries such as India), feminist pedagogical perspectives on the notion of transactional distance, the relationship between masculinity and gerontology from the perspective of non- traditional modes, and the interrelationships between gender and social media from a distance education perspective. As opposed to the conventional, physical classroom, the virtual classroom often occupies a de- privileged space in feminist pedagogical discussions, since it appears to align itself less easily with feminist praxes which encourage a free, intellectual exchange between teachers and students. By opening up various facets of the relationship between gender, distance education and feminist pedagogy, the book foregrounds the critical need to re- visit preconceived, unfavourable assumptions about this relationship and proposes mutually productive inter-linkages. It does so in the context of contemporary circumstances defined by the increasing use of virtual technology, the ongoing need for democratization of higher education and the constraints posed by consumerist trends. Lucid and topical, this Focus volume will be useful to scholars and researchers of higher education, open and distance education, feminist pedagogy, gender studies, feminism, masculinity, and women's studies as well as practitioners and policymakers working in the education sector.

Ontological Engineering approach of developing Ontology of Information Science Ahlam F. Sawsaa,2015-06-25 Ontology has been a subject of many studies carried out in artificial intelligence (AI) and information system communities. Ontology has become an important component of the semantic web, covering a variety of knowledge domains. Although building domain ontologies still remains a big challenge with regard to its designing and implementation, there are still many areas that need to create ontologies. Information Science (IS) is one of these areas that need a unified ontology model to facilitate information access among the heterogeneous data resources and share a common understanding of the domain knowledge. Recently, the development of domain ontologies has become increasingly important for knowledge level interoperation and information integration. They provide functional features for AI and knowledge representation. Domain Ontology is a central foundation of growth for the semantic web that provides a general knowledge for correspondence and communication among heterogeneous systems. Particularly with a rise of ontology in the artificial intelligence (AI) domain, it can be seen as an almost inevitable development in computer science and AI in general.
