The Brain and Spinal Cord in 3D Jack Becker, Chris Hayhurst, 2015-07-15 Everyone knows that the brain is responsible for our smarts and the spinal cord holds us up, but students may be surprised to learn how much more these powerhouses are responsible for. Together they control the nervous system. Without them, we would not be able to think, remember, digest nutrients, breathe, blink, swallow, and so much more. Featuring clear and arresting 3D illustrations, this volume takes readers through the brain and spinal cord, covering their parts and functions, and serves as a comprehensive introduction to the human body.

Neuroanatomy Martin C. Hirsch, Thomas Kramer, 2012-12-06 The topographical and functional architecture of the human brain is highly complex. This stereoscopic atlas provides new insight into the human brain. The illustrations in this stereoscopic atlas have been developed using a new 3D-visualization computer model. In combination with the CD-ROM, which contains all 173 illustrations as rotatable 3D models, this innovative atlas provides a new conception of spatial structures. It has never been so easy to understand the architecture of the human brain!

Neuroanatomy Martin C. Hirsch, Thomas Kramer, 2013-04-30 Preface There were mainly two motivation forces behind the development of this atlas: on the one hand we had the support and assistance of Till Hagemann and on the other hand we had the wish to make the complex three-dimensional structure of the human brain more comprehensible due to stereoscopic methods. On the other hand we wanted to make the atlas beautiful. Let us make a final remark: You can help us to improve the attempt of an aesthetic approach to the architecture of the human brain by visualizing, if you discover

In Vivo Atlas of Deep Brain Structures S. Lucerna,F.M. Salpietro,C. Alafaci,F. Tomasello,2012-12-06 This 'in vivo' atlas contains more than 50 magnetic resonance (MR) images of the brain. Each structure is represented in the axial, coronal and sagittal plane, magnified in colour schemes and reconstructed in 3D images with a useful millimetric scale. The atlas offers the reader a practical and simple tool for surgical planning and for diagnostic and anatomical studies. The high level of anatomical definition of the in vivo MR images means that there is no loss in precision as a result of post-mortem changes. No doubt, this book is an excellent teaching instrument for all students of the neurosciences, regardless of the individual level of training and expertise.

An Adjustable 3D Brain Atlas for Quantitative Analysis of Neuroimaging Data Lennart Thurfjell,1994

Segmentation of 3D Brain MRI Images Using Active Contours and Shape Priors Radina Vladimirova Droumeva,2010 Image processing is an important tool in research and treatment design in the medical industry. One area of image processing is segmentation: the process of finding objects in an image. This thesis develops a segmentation algorithm for finding the eyeballs in 3D MRI human brain images. An integral part of this is the prior knowledge of the general position, shape,

and size of the eyeballs. The segmentation is done in two stages: first, the most likely position of the eyeballs is found using a shape prior (a representation of two spherical objects with specific size and distance apart), followed by a stage of more precise active contour segmentation in the relevant area. The design process of this algorithm can be used to develop a similar segmentation procedure to look for different objects in the human brain, or in other types of images.

The Human Brain Henri M. Duvernoy, 1999-06-08 Serial sections - 2 mm thick - of the cerebral hemispheres and diencephalon in the coronal, sagittal, and horizontal planes. So as to point out the level of the sections more accurately, each is shown from different angles -- emphasising the surrounding hemisphere surfaces. This 3D approach has proven to be extremely useful when apprehending the difficult anatomy of the gyri and sulci of the brain. Certain complex cerebral structures such as the occipital lobe, the deep grey matter and the vascularization are studied here in greater detail. This second edition has been completely revised and updated, 44 serial sections have been added, while old MRI figures have been replaced by newer ones.

Accelerating a Medical 3D Brain MRI Analysis Algorithm Using a High-performance Reconfigurable Computer Jahyun J. Koo, 2007 Many automatic algorithms have been proposed for analyzing Magnetic Resonance Imaging (MRI) data sets. These algorithms allow clinical researchers to analyze their quantitative data with consistently accurate results. With the increasingly large data sets being used in brain mapping, there has been a significant rise in the need for methods to accelerate these algorithms, as their computation can consume many hours. This thesis presents the

results from a study on implementing such quantitative analysis algorithms on High-Performance Reconfigurable Computers (HPRCs). The Partial Volume Estimation (PVE), a brain tissue classification algorithm for MRI, was implemented on two SGI RASC RC100 systems using the Mitrion-C High-Level Language (HLL). The CPU-based PVE algorithm was profiled to identify the computationally intensive functions and two floating-point functions, estimating the probability densities (PDs) of tissues and the prior information, were implemented on FPGA-accelerators. Several simulated and real human brain MR images were used to evaluate the accuracy and performance improvement of the FPGA-based PVE algorithm. The Sensitivity and Kappa coefficients were calculated to verify the accuracy of the images resulting from the FPGA-based implementation. The FPGA-based PDs estimation and prior information estimation function achieved an average speedup of 2.5X and 9.4X, respectively. The overall performance improvement of the FPGA-accelerated PVE algorithm over the conventional CPU-based algorithm was 5.1X with four FPGAs. --

Development of Texture Weighted Fuzzy C-means Algorithm for 3D Brain MRI Segmentation Ji Young Lee, 2018

Axons and Brain Architecture Kathleen Rockland, 2015-12-12 Several excellent monographs exist which deal with axons. These, however, focus either on the cellular and molecular biology of

axons proper or on network organization of connections, the latter with only an incidental or abstract reference to axons per se. Still relatively neglected, however, is the middle ground of terminations and trajectories of single axons in the mammalian central nervous system. This middle level of connectivity, between networks on the one hand and local, in vitro investigations on the other, is to some extent represented by retrograde tracer studies and labeled neurons, but there have so far been many fewer of the complementary anterograde studies, with total visualization of the axonal arborization. The present volume brings together in one source an interrelated treatment of single axons from the perspective of microcircuitry and as substrates of larger scale organization (tractography). Especially for the former area - axons in microcircuitry - an abundance of published data exists, but these are typically in specialty journals that are not often accessed by the broader community. By highlighting and unifying the span from microcircuitry to tractography, the proposed volume serves as a convenient reference source and in addition inspires further interactions between what currently tend to be separate communities. The volume also redresses the imbalance between in vitro/local connectivity and long-distance connections. Focusing on mammalian systems, Part 1 of this book is devoted to anatomical investigations of connections at the single axon level, drawing on modern techniques and classical methods from the 1990s. A particular emphasis is on broad coverage of cortical and subcortical connections from different species, so that common patterns of divergence, convergence, and collateralization can be easily appreciated. Part 2 addresses mechanisms of axon guidance, as these seem particularly relevant to pathways and branching patterns. Part 3 covers axon dynamics and functional aspects; and Part 4 focuses on tractography, notably including comparisons between histological substrates and imaging.

The 3D Stereotaxic Brain Atlas of the Degu Noriko Kumazawa-Manita, Tsutomu

Hashikawa,Atsushi Iriki,2018-10-08 This book is the first digital atlas of the degu brain with microscopic features simultaneously in Nissl sections and magnetic resonance imaging (MRI). As an experimental animal model, the degu contributes to a variety of medical research fields in diabetes, hyperglycemia, pancreatic function, and adaptation to high altitude, among others. Recently the degu has gained increasing importance in the field of neuroscience, particularly in studies evaluating the relationship between sociality and cognitive brain functions, and in studies pertaining to the evolutionary aspects of the acquisition of tool-use abilities. Furthermore, aging-related brain dysfunction in humans can be studied using this animal model in addition to mammals with much longer lifespans. This brain atlas is constructed to provide histological and volume-rendered information simultaneously, fitting with any spatial coordination in brain positioning. It can be a useful guide to degus as well as to other rodents for studies of brain structures conducted using MRI or other contemporary examination methods with volume-rendering functions.

Nanobrain Anirban Bandyopadhyay,2020-04-03 Making an artificial brain is not a part of artificial intelligence. It will be a revolutionary journey of mankind exploring a science where one cannot write an equation, a material will vibrate like geometric shape, and then those shapes will change to make decisions. Geometry of silence plays like a musical instrument to mimic a human brain; our thoughts, imagination, everything would be a 3D shape playing as music; composing music would be the brain's singular job. For a century, the Turing machine ruled human civilization; it was believed that irrespective of complexity all events add up linearly. This book is a thesis to explore the science of decision-making where events are 3D-geometric shapes, events grow within and above, never side by side. The book documents inventions and discoveries in neuroscience, computer science, materials science, mathematics and chemistry that explore the possibility of brain

or universe as a time crystal. The philosophy of Turing, the philosophy of membrane-based neuroscience and the philosophy of linear, sequential thought process are challenged here by considering that a nested time crystal encompasses the entire conscious universe. Instead of an algorithm, the pattern of maximum free will is generated mathematically and that very pattern is encoded in materials such that its natural vibration integrates random events exactly similar to the way nature does it in every remote corner of our universe. Find how an artificial brain avoids any necessity for algorithm or programming using the pattern of free will.

MRI Atlas of Human White Matter Kenichi Oishi, Andreia V. Faria, Peter C M van Zijl, Susumu Mori, 2010-11-12 MRI Atlas of Human White Matter presents an atlas to the human brain on the basis of T 1-weighted imaging and diffusion tensor imaging. A general background on magnetic resonance imaging is provided, as well as the basics of diffusion tensor imaging. An overview of the principles and limitations in using this methodology in fiber tracking is included. This book describes the core white-matter structures, as well as the superficial white matter, the deep gray matter, and the cortex. It also presents a three-dimensional reconstruction and atlas of the brain white-matter tracts. The Montreal Neurological Institute coordinates, which are the most widely used, are adopted in this book as the primary coordinate system. The Talairach coordinate system is used as the secondary coordinate system. Based on magnetic resonance imaging and diffusion tensor imaging, the book offers a full segmentation of 220 white-matter and gray-matter structures with boundaries. Visualization of brain white matter anatomy via 3D diffusion tensor imaging (DTI) contrasts and enhances relationship of anatomy to function Full segmentation of 170+ brain regions more clearly defines structure boundaries than previous point-and-annotate anatomical labeling, and connectivity is mapped in a way not provided by traditional atlases
