*Growth in Open Economies* J.A. Hanson,2012-12-06 The years following World War II have witnessed an increasing interest in the effects of growth on trade, the patterns of international specialization, and the terms of trade. On the one hand, some English economists have maintained the Ricardian tradition of diminishing returns, rising food prices and, therefore, declining British terms of trade, while, on the other hand Prebisch, Singer, and other critics have attempted to document and explain a long-run decline in the terms of trade of the underdeveloped countries. Finally, in a reaction to this concentration on a single factor as the determinant of international price movements, a group of economists, began a systematic investigation of the role of growth in trade and the terms of trade using neoclassical assumption. This study, particularly in its assumptions regarding demand, falls into the tradition of the last group. However, it extends the tradition by treating growth as a continuous process, dependent on saving out of produced income and the growth rate of population in two trading economies. Therefore, in addition to answering the comparative statics questions regarding the trends in the terms of trade, it develops the conditions which guarantee that the two economies will approach a state of unique long-run balanced growth, in which all per capita variables, as well as the terms of trade, stabilize. Moreover, these methods permit some discussion of changes in the patterns of specialization.

**Constrained Extrema Introduction to the Differentiable Case with Economic Applications** M.A. El-Hodiri,2012-12-06 These notes are the result of an interrupted sequence of seminars on optimization theory with economic applications starting in 1964-1965. This is mentioned by way of explaining the uneven style that pervades them. Lately I have been using the notes for a two semester course on the subject for graduate students in economics. Except for the introductory survey, the notes are intended to provide an appetizer to more sophisticated aspects of optimization theory and economic theory. The notes are divided into three parts. Part I collects most of the results on constrained extremal of differentiable functionals on finite and not so finite dimensional spaces. It is to be used as a reference and as a place to find credits to various authors whose ideas we report. Part II is concerned with finite dimensional problems and is written in detail. Needless to say, my contributions are marginal. The economic examples are well known and are presented by way of illustrating the theory. Part III is devoted to variational problems leading to a discussion of some optimal control problems. There is a vast amount of literature on these problems and I tried to limit my intrusions to explaining some of the obvious steps that are usually left out. I have borrowed heavily from Akhiezer [ 1], Berkovitz [ 7], Bliss [10] and Pars [40]. The economic applications represent some of my work and are presented in the spirit of illustration.

*Foundations of Non-stationary Dynamic Programming with Discrete Time Parameter* K. Hinderer,2012-12-06 The present work is an extended version of a manuscript of a course which the author taught at the University of Hamburg during summer 1969. The main purpose has been to give a rigorous foundation of stochastic dynamic programming in a manner which makes the theory easily applicable to many different practical problems. We mention the following features which should serve our purpose. a) The theory is built up for non-stationary models, thus making it possible to treat e.g. dynamic programming under risk, dynamic programming under uncertainty, Markovian models, stationary models, and models with finite horizon from a unified point of view. b) We use that notion of optimality (p-optimality) which seems to be most appropriate for practical purposes. c) Since we restrict ourselves to the foundations, we did not include practical problems and ways to their numerical solution, but we give (cf. section 8) a number of problems which show the diversity of structures accessible to non stationary dynamic programming. The main sources were the papers of Blackwell (65), Strauch (66) and Maitra (68) on stationary models with general state and action spaces and the papers of Dynkin (65), Hinderer (67) and Sirjaev (67) on non-stationary models. A number of results should be new, whereas most theorems constitute extensions (usually from stationary models to non-stationary models) or analogues to known results.

**The Coordinate-Free Approach to Gauss-Markov Estimation** H. Drygas,2012-12-06 These notes originate from a couple of lectures which were given in the Econometric Workshop of the Center for Operations Research and Econometrics (CORE) at the Catholic University of Louvain. The participants of the seminars were recommended to read the first four chapters of Seber's book [40], but the exposition of the material went beyond Seber's exposition, if it seemed necessary. Coordinate-free methods are not new in Gauss-Markov estimation, besides Seber the work of Kolmogorov [11], Scheffe [36], Kruskal [21], [22] and Malinvaud [25], [26] should be mentioned. Malinvaud's approach however is a little different from that of the other authors, because his optimality criterion is based on the ellipsoid of concentration. This criterion is however equivalent to the usual concept of minimal covariance-matrix and therefore the result must be the same in both cases. While the usual theory gives no indication how small the covariance-matrix can be made before the optimal estimator is computed, Malinvaud can show how small the ellipsoid of concentration can be made: it is at most equal to the intersection of the ellipsoid of concentration of the observed random vector and the linear space in which the (unknown) expectation value of the observed random vector is lying. This exposition is based on the observation, that in regression analysis and related fields two conclusions are or should preferably be applied repeatedly.

*Introduction to Optimization Theory in a Hilbert Space* A.V. Balakrishnan,2012-12-06 This book is based on lectures given in a one-quarter course at UCLA. The aim is to present some of the basic concepts and techniques of Functional Analysis of relevance to optimization problems in Control, Communication and other areas in System Science. The students are expected to have had an introductory course in Hilbert Space theory. Some effort has been made to be self-contained mainly in order that the vocabulary used can be clarified. A minimal bibliography is appended. The author is indebted to Jiri Ruzicka and Jerome Mersky for help with proof-reading. Professor L. Berkovitz looked over and made many helpful comments on parts of an early version. Thanks are also due to Trudy Cook for typing the manuscript. Grateful acknowledgment is also made of partial support under AFOSR Grant No. 68-1408, Applied Mathematics Division, United States Air Force.

*Yavneh* Raz Kletter,Irit Ziffer,Wolfgang Zwickel,2010 In the words of late Professor Moshe Kochavi, the Philistine repository pit at Yavneh is the kind of discovery made only once every fifty years. It is the richest repository pit ever found from Bronze and Iron Ages Israel/Palestine, containing thousands of cultic finds originating from a temple, including an unprecedented number - more than a hundred - of cult stands (so-called 'architectural models') carrying rich figurative art, dozens of fire-pans, chalices and other objects. The present volume includes the full publication of the excavation, the stratigraphy, the cult stands and the figures detached from cult stands, several clay and stone altars and some pottery vessels related to burning of plant material, most likely incense. This exceptional book raises a host of highly important and intriguing questions. Is this a favissa, or even a genizah? Why are many cult stands badly broken, while some are intact - were cult stands

broken on purpose? What is the explanation for the unique stratigraphy and for the layer of gray ash in the pit - was fire kindled inside as part of a ritual? How do we know that these finds are Philistine? Are they part of the 'furniture' of the temple or objects dedicated by worshippers as votives? Do the figures on the cult stands represent mortal beings, or divinities? If divinities, can we relate them with Biblical or extra-biblical data on the gods of the Philistines? What was the function/s of cult stands? Were they models of buildings, supports for images, offering tables, altars, or perhaps incense burners? Why are female figures dominant, while male figures are virtually absent? In discussing such topics, Yavneh I treats issues that are central to many fields of study: religion and cult in Iron Age Israel/Palestine; the history and archaeology of the Philistines and their 'western' relations; Near Eastern iconography, the meaning of cult stands/architectural models and the understanding of votive objects and of repository pits in general. Literally salvaged from the teeth of a bulldozer, these rare finds are now published. Generations of scholars will discuss and reinterpret them - there is no 'final word' for such finds and hence, this final excavation volume is not an end, but a beginning.

4th IFAC/IFIP International Conference on Digital Computer Applications to Process Control M. Mansour, W. Schauffelberger, 2013-06-29 Digital computers have been used more and more to control different industrial processes during the last decade. As of today, many systems are designed to include a process control computer as a vital part. The use of computers has created a need for sophisticated methods for the operation and supervision of complex industrial processes. To summarize the state of the art from the practical as well as from the theoretical point of view, the 4th IFAC/IFIP International Conference on Digital Computer Applications to Process Control will be held at Zurich from March 19 to 22, 1974. The first two volumes of the proceedings contain the accepted papers submitted to the conference mentioned above. The papers are arranged according to the topics of the conference. A third volume will include the six following survey papers: 1. Digital Control Algorithms Prof. A. P. Sage, Dallas Texas I USA 2. Interface Problems for Process Control Prof. T. J. Williams, Lafayette Indiana I USA 3. Software for Process Computers Dr. J. Gertler, Budapest I Hungary Dr. J. Sedlak, Prague I CSSR 4. Digital Computer Applications in Metallurgical Processes Mr. W. **Topological Methods in Walrasian Economics** E. Dierker, 2012-12-06 In winter 71/72 I held a seminar on general equilibrium theory for a joint group of students in mathematics and in economics at the university of Bonn, w. Germany. The economists, however, had a mathematical background well above the average. Most of the material treated in that seminar is described in these notes. The connection between smooth preferences and smooth demand functions [ see Debreu (1972) ] and regular economies based on agents with smooth preferences are not presented here. Some pedagogical difficulties arose from the fact that elementary knowledge of algebraic topology is not assumed although it is helpful and indeed necessary to make some arguments precise. It is only a minor restriction, at present, that functional analysis is not used. But with the development of the theory more economic questions will be considered in their natural infinite dimensional setting. Economic knowledge is not required, but especially a reader without economic background will gain much by reading Debreu's classic Theory of Value (1959). Although the formulation of our economic problem uses a map between Euclidean spaces only, we shall also consider manifolds. Manifolds appear in our situation because inverse images under differentiable mappings between Euclidean spaces are very often differentiable manifolds. ( Under differentiability assumptions, for instance, the graph of the equilibrium set corresponds

**Linear Multiobjective Programming** M. Zeleny, 2012-12-06 1.1. The origin of the multiobjective problem and a short historical review The continuing search for a discovery of theories, tools and concepts applicable to decision-making processes has increased the complexity of problems eligible for analytical treatment. One of the more pertinent criticisms of current decision-making theory and practice is directed against the traditional approximation of multiple goal behavior of men and organizations by single, technically-convenient criterion. Reinstatement of the role of human judgment in more realistic, multiple goal settings has been one of the more recent developments in the literature. Consider the following simplified problem. There is a large number of people to be transported daily between two industrial areas and their adjacent residential areas. Given some budgetary and technological constraints we would like to determine optimal transportation modes as well as the number of units of each to be scheduled for service. What is the optimal solution? Are we interested in the cheapest transportation? Do we want the fastest, the safest, the cleanest, the most profitable, the most durable? There are many criteria which are to be considered: travel times, consumer's cost, construction cost, operating cost, expected fatalities and injuries, probability of delays, etc.

Cluster Analysis B. S. Duran, P. L. Odell, 2013-03-08 A tremendous amount of work has been done over the last thirty years in cluster analysis, with a significant amount occurring since 1960. A substantial portion of this work has appeared in many journals, including numerous applied journals, and a unified exposition is lacking. The purpose of this monograph is to supply such an exposition by presenting a brief survey on cluster analysis. The main intent of the monograph is to give the reader a quick account of the problem of cluster analysis and to expose to him the various aspects thereof. With this intent in mind much detail has been omitted, particularly in so far as detailed examples are considered. Most of the references stated within the text contain examples and the reader can consult them for additional information on specific topics. Efforts were made to include in the reference section all papers that played a role in developing the theory of cluster analysis. Any omission of such references was not intentional and we would appreciate knowing about them. Many references to papers in applied journals are also contained, however, the list is far from being complete. This monograph has been greatly influenced by the work of many people, most notably, J. A. Hartigan, D. Wishart, J. K. Bryan, R. E. Jensen, H. D. Vinod, and M. R. Rao. Several portions of the monograph were motivated by research performed under the support of NASA Manned Spacecraft Center, Earth Observations Division, under Contract NAS 9-12775.
